WESTMINSTER HOSPITAL.—The hospital contains 215 beds and affords relief to upwards of 2000 in-patients and 30,000 out-patients annually. There are separate departments for Diseases of the Eye, Ear, Skin, Teeth, and Throat, for Orthopædic practice, for Diseases of Women, for Diseases of Children, for Radiography, and for the Light Treatment. The Anatomical, Pathological, and Materia Medica Museums are open to all students of the school.

A medical and a surgical registrar, each with a salary of £50, are appointed annually. Two house physicians, three house surgeons, and a resident obstetric assistant are appointed for six months after examination, and are pr vided with rooms and commons; also one assistant hou physician and one assistant house surgeon with commo only. Clinical assistants to the assistant physicians a assistant surgeons, and to the officers in charge of speci departments, are appointed from among qualified studen of the hospital.

By a scheme for the concentration of the teaching of t preliminary and intermediate subjects of the curriculu which has the support of the London University, a arrangement has been made by the Westminster scho for the teaching of these subjects at King's Colleg Students, however, join the Westminster Medical Scho as formerly and the Entrance Scholarships remain a heretofore.

There is laboratory accommodation for practical work i Chemistry, Physics, Biology, Anatomy, Physiology, Hist logy, Pathology, and Bacteriology, and a new Clinica Laboratory has recently been erected. Facilities for r search are afforded in all the laboratories.

For out-door recreation the following clubs exist: th Athletic Sports Club, the Cricket, Lawn Tennis, an Swimming Clubs, and the Rugby and Association Footba Clubs. For in-door recreation there are the Students' Clu the Chess Club, and the Guthrie Society, the last-name being a debating club. These clubs and societies togethe constitute the Clubs Union, for membership of whic students are not required to pay, the expense being covere by the entrance fee to the school.

Staff.—Consulting Medical Staff: Dr. H. B. Donkin and Sir William H. Allchin. Consulting Surgical Staff: Mr. Richard Davy, Mr. G. Cowell, and Mr. N. C. Macnamara. Medical In-patient Staff: Dr. de Havilland Hall, Dr. W. Murrell, and Dr. R. G. Hebb. Obstetric Physician: Dr. W. Rivers Pollock. Surgical In-patient Staff: Mr. C. Stonham, Mr. W. G. Spencer, and Mr. A. H. Tubby. Medical Out-patient Staff: Dr. A. M. Gossage, Dr. Purves Stewart, Dr. Eric Macnamara, and Dr. Carmalt-Jones. Physician for Diseases of the Skin: Dr. T. Colcott Fox. Assistant Obstetric Physician: Dr. G. H. Drummond Robinson. Surgical Out-patient Staff: Mr. W. Turner, Mr. Arthur Evans, Mr. Rock Carling, and Mr. J. M. G. Swainson. Surgeon in Charge of the Throat Department: Mr. P. R. W. De Santi. Ophthalmic *Surgeon*: Mr. G. Hartridge. Surgeon in charge of the Orthopædic Department: Mr. A. H. Tubby. Surgeon in charge of the Ear Department: Mr. P. R. W. De Santi. Dental Surgeons: Mr. C. W. Glassington and Mr. E. Gardner. Administrators of Anæsthetics: Dr. N. W. Bourns and Dr. V. B. Orr. Assistant Anæsthetist: Dr. Cecil Hughes. Physician Pathologist: Dr. R. G. Hebb. Assistant Pathologist and Curator of Museum: Dr. J. M. Bernstein. Medical Registrar: Dr. H. F. Marris. Surgical Registrar: Mr. J. J. W. Evans. Pharmacist: Mr. A. E. Tanner. Secretary: Mr. S. M. Quennell.

Lecturers.—Clinical Medicine: Sir William Allchin, Dr. Hall, Dr. Murrell, and Dr. Hebb. Clinical Surgery: Mr. Stonham, Mr. Spencer, and Mr. Tubby. Clinical Gynæcology: Dr. Pollock (treasurer of the school). Medicine: Dr. Murrell, Dr. Hebb, Dr. Gossage, Dr. Purves Stewart, Dr. Macnamara, Dr. Duncan, and Dr. Carmalt Jones. Diseases of the Skin: Dr. Colcott Fox. Insanity: Dr. Stoddart. Surgery: Mr. Spencer. Ophthalmic Surgery: Mr. Hartridge. Surgery of the Throat and Nose: Mr. De Santi. Orthopædic Surgery: Mr. Tubby. Aural Surgery: Mr. De Santi. Dental Surgery: Mr. Glassington. Anæsthetics: Dr. Bourns. Operative Surgery: Mr. Stonham. Surgical Anatomy: Mr. Arthur Evans. Practical

Surgery: Mr. Rock Carling (Dean of the school) and Mr. Swainson. Surgical Pathology: Mr. Turner. Midwifery and Diseases of Women: Dr. Pollock. General Pathology and Morbid Anatomy: Dr. Hebb. Post-mortem Demonstrations: Dr. Hebb. Materia [illegible] Pharmacology: Dr. Dixon. [illegible] Pharmacy: Mr. A. E. Tanner [illegible] Henslowe Wellington. Toxicology: Dr. H. Wilson Hake. Public Health: Dr. S. Monckton Copeman. Bacteriology: Dr. Bernstein. Anatomy: Dr. Thompson and Mr. Jenkins. Demonstrator of Practical Anatomy: Mr. Jenkins. Physiology: Dr. Halliburton. Practical Physiology and Histology: Dr. Halliburton, Dr. Lyle, Dr. Myers, and Dr. Rosenheim. Biology: Dr. Bottomley and Dr. Dendy. Chemistry and Practical Chemistry: Dr. Thomson, Mr. Jackson, and Mr. Kirkaldy. Physics: Mr. Allen, Mr. Nicol, and Dr. W. Wilson. Secretary and Librarian: Mr. W. Fryer.

Scholarships and Prizes.—At this school the first five items in the following list are for students entering in the Winter Session. The money value and subjects of examination are as follows: (*a*) Guthrie Entrance Scholarship open to Students under 25 years of age, £60, Latin; Mathematics, English, and Greek, French, or German; (*b*) and (*c*), two Entrance Scholarships, age of candidates and subjects of examination as above, £40 and £30 respectively; (*d*) Dental Scholarship, age of candidates and subjects of examination as above, £20; (*e*) Natural Science Prize, £60, subjects of Preliminary Scientific of University of London; (*f*) and (*g*), two Entrance Scholarships in Arts for Students entering in the Summer Session, £60 and £40 respectively—conditions as for the Guthrie Scholarship; (*h*) Free Presentation, open to Pupils of the Epsom Medical College and obtained by recommendation; (*i*) Entrance Scholarship, £40, Chemistry and Physics according to the synopsis of the Conjoint Board; (*j*) and (*k*), two University Scholarships open to University Students, £60 and 70 guineas respectively, Anatomy and Physiology; (*l*) Natural Science Prize, £60, subjects of Preliminary Scientific of University of London; (*m*) Sturges Prize in Clinical Medicine, about £6, Notes of Cases; (*n*) Clinical Surgery Prize, £5, Notes of Cases; (*o*) Chadwick Prize, £21 in books or instruments, Medicine and Surgery, including Pathology and Applied Anatomy and Physiology; (*p*) Frederic Bird Medal and Prize open to Fourth-year Students, £14 in medal and books or instruments—*Midwifery, Diseases of Women, Medicine, and* Pathology; (*q*) Abrahams Prize in Clinical Pathology, 5 guineas, a Paper and Tests in Practical Work; (*r*) Alfred Hughes Memorial Prize, open to Second-year Sudents, about £5 in books or instruments—Anatomy; (*s*) Carter Gold Medal and Prize for Botany, open to Students of not more than three years' attendance, gold medal and books of the joint value of £15; (*t*) Jelf Medal awarded to Third-year Students; (*u*) Second-year Scholarship, £20, Elementary Anatomy, Physiology, Histology, and Organic Chemistry; (*v*) Third-year Scholarship, £20, Anatomy, Physiology, Pharmacology, and Materia Medica; (*w*) Daniell Scholarship, tenable for two years, £20, Chemistry; and (*x*) Rabbeth Scholarship, open to first-year students, £20, Class Examinations in the Preliminary Scientific Course.

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN, 8, Hunter-street, Brunswick-square, W.C.—The fee for the medical course for the University of London, after the completion of the First Medical Examination Course is £135 in one sum, or £145 in four instalments. The fee for the First Medical classes is £25. The fee for the course for the University of Durham, the Society of Apothecaries, and the Conjoint Colleges of Scotland, including Elementary Science, is £140 in one sum, or £150 in four instalments.

The hospital contains 165 beds, of which 78 are reserved for surgical, 64 for medical, 13 for gynæcological, six for ophthalmic, and four for isolation cases. The number of in-patients treated during the past year was 2218. There is also a department for attending women in their confinements at their own homes. Students can also attend the in-patient and out-patient practice of the New Hospital for Women.

Special classes for the First Medical Examination of the University of London are held and special courses of instruction in Anatomy, Physiology, and Practical Pharmacology are provided for students preparing for the Second Medical Examination of the University of London.

Students after qualification can hold at the Royal Free Hospital the posts of house physician, house surgeon, clinical assistants, anæsthetist and assistant anæsthetists, medical and surgical registrars, medical electrician, and museum curator; and at the Medical School the posts of demonstrators in the departments of Anatomy, Physiology, Chemistry, and museum curator. They can also hold posts at the New Hospital for Women, which is officered entirely by medical women.

The School buildings have been entirely rebuilt in recent years and there are spacious, well-equipped laboratories, which afford every facility for efficiency of teaching and practical work in all departments.

There are residential chambers at 8, Hunter-street, with accommodation for 17 students, and the Secretary can be consulted on the subject of other residences for students. There is a Tennis Club with a gravel court at the School, and also hockey, boating, and other clubs.

Staff.—Consulting Physician: Dr. S. West. Physicians: Dr. Harrington Sainsbury, Dr. J. W. Carr, and Dr. A. G. Phear. Assistant Physicians: Dr. Farquhar Buzzard and Dr. W. P. S. Branson. Consulting Surgeons: Mr. W. Rose and Mr. A. B. Barrow. Surgeons: Mr. J. Berry, Mr. E. W. Roughton, and Mr. W. H. Evans. Assistant Surgeons: Mr. T. Percy Legg and Mr. Cunning. Consulting Physician for Diseases of Women: Mrs. Scharlieb, M.S., M.D. Physician for Diseases of Women: Mrs. Vaughan-Sawyer, M.S., M.D. Assistant Physician for Diseases of Women: Mrs. Willey, M.S., M.D. Ophthalmic Surgeon: Mr. H. Work Dodd. Surgeon for Diseases of Throat, Nose, and Ear: Mr. E. W. Roughton. Surgeon for Diseases of Skin: Mr. W. H. Evans. Senior Resident Medical Officer: Mr D. W. Roy. Registrars: Miss Woodward, M.D., B.S., and Miss Turnbull, M.D., B.S. Dentist: Mr. T. C. Budden. Anæsthetists: Mrs. Berry, M.D., B.S., and Miss Gates, M.B., B.S. Secretary: Mr. C. W. Thies.

Lecturers.—At the School: Anatomy and Practical Anatomy: Mr. Parsons. Physiology and Practical Physiology: Miss Cullis, D.Sc. Chemistry: Miss C. de B. Evans, D.Sc. Practical Chemistry: Miss Widdows, B.Sc. Physics: Miss E. Stoney, M.A. Biology: Mr. Mudge, A.R.C.S. Materia Medica: Dr. R. H. P. Crawfurd. Practice of Medicine: Miss Cock, M.D., and Dr. J. W. Carr. Midwifery: Mrs. Scharlieb, M.S. Gynæcology: Mrs. Stanley Boyd, M.D. Forensic Medicine: Dr. Hawthorne. Toxicology: Dr. Wilson Hake. Practice of Surgery: Mr. Berry and Mr. Roughton. Operative Surgery: Mr. Roughton. Ophthalmic Surgery: (vacant). Pathology: Dr. L. S. Dudgeon. Mental Pathology: Dr. Hyslop. Tropical Diseases: Sir Patrick Manson. Operative Midwifery: Miss McCall, M.D., Mrs. Vaughan Sawyer, M.D., and Mrs. Willey, M.D., M.S. Demonstrator of Anatomy, Mrs. Addison, M.B., B.S.; of Physiology, Miss Simmons, B.Sc.; of Chemistry, Miss [illegible] Pathology: Dr. Buzzard. Bacteriology: Miss Chambers, M.D., B.S. Surgical Tutors: Mr. W. Evans, Mr. Legg, and Mr. Cunning. Medical Tutor: Dr. A. G. Phear. Demonstrator of Auscultation: Dr. Phear. Demonstrator of Practical Clinical Pathology: Miss Chambers, M.D., B.S. Practical Pathology: Miss D. Hare, M.D., B.S.

Dean of the School, Miss Cock, M.D.; Honorary Secretary, Dr. May Thorne; Secretary and Warden, Miss L. M. Brooks.

Scholarships and Prizes.—At this School candidates for the second item (*b*) on the following list must be (1) not more than 20 years of age on June 1st preceding the examination; (2) resident in the Metropolitan Police district; (3) Matriculated Students of the University of London; and (4) in need of an Exhibition for the prosecution of their medical studies. The third item (*c*) is given as the result of an examination held by the University of London in June to a student who has passed the First or Second Medical Examinations of that University held in the previous July or the July following the examination. Candidates are expected to read for the M.B., B.S. degree of the University of London. The money value and subjects of examination are as follows: (*a*) Entrance Scholarship, £30, English, Latin, Arithmetic, Euclid, and Algebra; (*b*) St. Dunstan's Medical Exhibition, tenable for three years, extendible to five years, £60, English, Latin, Arithmetic, Euclid, and Algebra; (*c*) Bostock Scholarship, tenable for two or four years, and next to be awarded in June, 1911, £60; (*d*) Mabel Webb Research Scholarship, tenable for one year and renewable, £30, Physiology, Chemistry, or Pathology; (*e*) Fanny Butler Scholarship, tenable for four years; Candidates must be willing to work in connexion with the Church of England Zenana Missionary Society; next award in September, 1909, £14 10*s.*; (*f*) John Byron Bursary, tenable from two to four years, for students already in the School requiring assistance for the prosecution of their medical studies, application to the Secretary by March 31st; next award in March, 1910, £20; (*g*) Helen Prideaux Scholarship, awarded every second year to a student who has become qualified during the two years immediately preceding the award, and to be spent in assisting the holder to further study, £40, Medicine, Surgery, Obstetric Medicine, and Pathology. Three Evans Prizes of £3 3*s.*, £2 2*s.*, and £1 1*s.* are given in alternate years on the results of the class examination in midwifery, and two Durham Prizes, value £5 and £3, are given in alternate years on the results of the class examination in gynæcology, and a prize of £5 is awarded in alternate years on the results of the class examination in Midwifery and Gynæcology respectively. The Evans Prize for Operative Midwifery, value £5 5*s.*, is awarded yearly. Prizes of £10 each are awarded yearly in Anatomy and Physiology. There is also a small fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help. Prizes and Certificates of Honour are awarded in each class at the end of the session.

UNIVERSITY OF DURHAM.

Two Diplomas and six degrees are conferred—viz., the Diploma in Public Health and the Diploma in Dental Surgery, and the degrees of Bachelor of Medicine, Bachelor of Surgery, Master of Surgery, Doctor of Medicine, Bachelor of Hygiene, and Doctor of Hygiene. These degrees are open both to Men and Women.

For the degree of *Bachelor of Medicine* there are four professional examinations. The subjects of the First Examination are—Elementary Anatomy and Elementary Biology, Chemistry, and Physics. The subjects of the Second Examination are—Anatomy, Physiology, Materia Medica, Therapeutics, Pharmacology, Pharmacy. The subjects for the Third Examination are—Pathology, Medical Jurisprudence, Public Health, and Elementary Bacteriology. The subjects of the Fourth Examination are—Medicine, Clinical Medicine and Psychological Medicine, Surgery and Clinical Surgery, Midwifery and Diseases of Women and Children.

It is required that at least one of the five years of professional education shall be spent in attendance at the University College of Medicine, Newcastle-upon-Tyne. Candidates who have passed the First and Second Examinations of the University will be exempt from First and Second Examinations of the Conjoint Board.

For the degree of *Bachelor of Surgery* every candidate must have passed the examination for the degree of Bachelor of Medicine of the University of Durham and must have attended one course of lectures on Operative Surgery and one course on Regional Anatomy. Candidates will be required to perform operations on the dead body and to give proof of practical knowledge of the use of surgical instruments and appliances.

For the degree of *Master of Surgery* candidates must not be less than 24 years of age and must satisfy the University as to their knowledge of Greek or German. In case they shall not have passed in one of these subjects at the Matriculation Examination for the M.B. degree they must present themselves at Durham for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.S. They must also have obtained the degree of Bachelor of Surgery of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Surgery, in attendance on the practice of a recognised hospital, or in the naval or military services, or in medical or surgical practice. The subjects of examination are:—Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations, Clinical Surgery.

For the degree of *Doctor of Medicine* candidates must be not less than 24 years of age and must satisfy the University as to their knowledge of Greek or German. In case they shall not have passed in one of these subjects at the Matriculation Examination for the M.B. degree they must present themselves at Durham for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.D. They must also have obtained the degree of Bachelor of Medicine of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Medicine in attendance on the practice of a recognised hospital, or in the military or naval services, or in medical and surgical practice. Each candidate must present an essay prepared entirely by himself, which must be typewritten, based on original research or observation, on some medical subject selected by himself, and approved of by the Professor of Medicine and must pass an examination thereon, and must be prepared to answer questions on the other subjects of his curriculum so far as they are related to the subject of the essay.

Doctor of Medicine (without residence).—The University of Durham has instituted a special examination whereby the degree of Doctor of Medicine may be obtained without residence. Candidates shall not be under 40 years of age and shall have been in active practice for 15 years as registered medical practitioners. They shall produce certificates of moral character from three registered members of the medical profession, and if they have not passed an examination in Arts previously to the Professional Examination in virtue of which they have been placed on the Register, they shall be required to pass in Classics and Mathematics. Candidates who have passed an examination in Arts previously to being placed on the Register are required to pass an examination in Latin. They will be examined in the Principles and Practice of Medicine, including Psychological Medicine, Hygiene, and Therapeutics, the Principles and Practice of Surgery, Midwifery, [illegible] Women and Children, Pathology (Medical [illegible] omy (Medical and Surgical), Medical [illegible] Toxicology. The fee will be 50 [illegible] 20 guineas will be retained if the candidate fails to satisfy the examiners.

Candidates for any of the above degrees must give at least 28 days' notice to Professor Howden, Secretary, College of Medicine, Newcastle-upon-Tyne. In the case of the M.D. (essay) examination candidates must send in their essays six weeks before the date of the examination.

Professors—Medicine: Sir G. H. Philipson, M.D., D.C.L. Surgery: F. Page, F.R.C.S. Physiology: T. Oliver, M.D. Anatomy: R. Howden, M.B. Midwifery: R. P. R. Lyle, M.D. Comparative Pathology: H. J. Hutchens, M.R.C.S.

Scholarships and Prizes.—In connexion with this University the following scholarships and prizes are awarded:—(*a*), (*b*), (*c*), and (*d*), Four Scholarships of £25 a year each, tenable for four years; the examination will be the September Matriculation Examination. Candidates must take English, Latin, Arithmetic, Euclid, Algebra, Geography, English History, with Greek or German, or both. (See College Calendar for special books.) Open to candidates desirous of being admitted as Medical Students. The successful candidates must take out their entire curriculum at the University of Durham College of Medicine, Newcastle upon-Tyne. (*e*) Pears Scholarship of £50 a year, tenable for three years; Matriculation Examination. —At the College of Medicine are: (*f*) Dickinson Scholarship, interest on £400 and gold medal; examination in Medicine, Surgery, Midwifery, and Pathology. *Open to full* students of the College of Medicine who have passed the third M.B. Examination. (*g*) Tulloch Scholarship, interest on £400; examination in Anatomy, Physiology, and Chemistry. No student is eligible who commenced his medical curriculum more than two academical years before the date of examination. (*h*) Charlton Memorial Scholarship, interest on £700; examination in Medicine. Open to full students of the College entered for the class on the Principles and Practice of Medicine. (*i*) Gibb Scholarship, interest on £500; awarded annually as a Scholarship in Pathology to full student who passes the best examination in that subject. No student is eligible after completion of his curriculum. (*j*) Luke Armstrong Memorial Scholarship, *interest on £680: original* essay on *some* subject in Comparative Pathology. (If no essay of sufficient *merit* be presented the scholarship may be awarded to the candidate who, in passing the first part of the Examination for the

B.Hy. Degree, ob[illegible] Comparative Path[illegible] Graduates in Med[illegible] degrees who have [illegible] whose age does [illegible] Scholarship, interest on £1000; original essay on any Surgical subject. Open to any graduate in Medicine or Surgery of the University or any student of the College of Medicine. [illegible] Scholarship [illegible] on Disease [illegible] Surgical Treatment. All Graduates in Medicine or Surgery of the University are eligible. (*m*) Gibson Prize, interest on £225; examination in subject of Midwifery and Diseases of Women and Children. Open to students who have attended one course of lectures on Midwifery and Diseases of Women and Children. (*n*) Turnbull Prize and Medal; examination in Surface Anatomy. Open to students at end of their second winter session.—At the Royal Infirmary is (*o*) Goyder Memorial Scholarship, interest on £325; awarded annually to student who most distinguishes himself in Clinical Medicine and Clinical Surgery at the Royal Infirmary.

Hygiene.—The regulations with regard to the degrees in Sanitary Science will be found under the section on Public Health.

Clinical Instruction.—THE COLLEGE OF MEDICINE, Newcastle-upon-Tyne.—A new wing has been added to accommodate the departments of physiology and bacteriology. It also contains a students' gymnasium and a set of Students' Union rooms. The new Royal Victoria Infirmary, containing upwards of 400 beds, was opened by His Majesty King Edward VII. in 1906. In the new infirmary [illegible] study of [illegible] ordinary [illegible] and Prizes [illegible] Scholarships, value £25, tenable for four years, for proficiency in Arts, awarded to full students in their first year. The Pears Scholarship, value £50 a year, tenable for three years (when vacant). The Dickinson Scholarship, value interest of £400, and a Gold Medal, for Medicine, Surgery, Midwifery, and Pathology. The Tulloch Scholarship, value the interest of £400, for Anatomy, Physiology, and Chemistry. The Charlton Scholarship, value the interest of £700, for Medicine. The Gibb Scholarship, value the interest of £500, for Pathology. The Goyder Memorial Scholarship (at the Infirmary), value the interest of £325, for Clinical Medicine and Clinical Surgery. The Luke Armstrong Memorial Scholarship, value the interest of £680, for Comparative Pathology. The Stephen Scott Scholarship in Surgery, value the interest of £1000. Heath Scholarship: The late Dr. George Yeoman Heath, President of the University of Durham College of Medicine, bequeathed the sum of £4000 to found a Scholarship in Surgery, the interest to be awarded every second year; the next award will be in 1910. The Gibson Prize, interest on £225, in the department of Midwifery and Diseases of Women and Children. The Turnbull Prize and Medal for Surface Anatomy. At the end of each session Prizes of Books are awarded in each of the regular classes. Assistant Demonstrators of Anatomy, Prosectors, and Assistant Demonstrators of Physiology and Pathology are elected yearly. Pathological Assistants, Assistants to the Dental Surgeon, Assistants in the Eye Department, Throat and Ear Department, and Skin Department, Clinical Clerks, and Dressers are appointed every three months.

NEWCASTLE-UPON-TYNE ROYAL VICTORIA INFIRMARY.—This Infirmary was founded in 1751 but has been recently rebuilt, the new hospital being opened in 1906. The number of beds is 425. The number of in-patients annually is 7500 and of out-patients 100,000. The medical students of the University of Durham attend the practice of this hospital. C[illegible] Surgeons [illegible] Tutorial [illegible] given in [illegible] opportunity [illegible] been spared [illegible] to medical and surgical in-patient and out-patient departments the following special departments are fully equipped fo[illegible] Throat and Ear, Skin, C[illegible] and Bacteriological. T[illegible]llowing laboratories: 1. *Special Pathological Laboratory*, attached to the post-mortem r[illegible] 2. [illegible]ry, in which all clinical [illegible] carried out—opsonic i[illegible] treatment by vaccines and serums, &c. 3. There is in addition a Clinical Laboratory attached to each ward and to the out-patient department. There are five operating theatres in use in the hospital, three large theatres, a smaller one for emergencies, and an out-patient theatre. The surgical practice is especially good; more than 6000 surgical operations were performed in the last 12 months. Every facility is given to students to take out the full or any part of the hospital curriculum, and clerkships or assistantships in any of the several special departments are open to undergraduates or graduates for periods of from one to three months. There are 11 resident medical and surgical officers, three of whom are paid, and preference for these appointments is given to students who have fulfilled their curriculum in the hospital. The sessions open on May 1st and Oct. 1st of each year. Applications for detailed information should be made to the Dean, Mr. H. B. Angus, at the hospital. The following is the staff of the hospital:—Physicians: Dr. David Drummond, Sir Thomas Oliver, Dr. T. Beattie, and Dr. W. E. Hume. Assistant Physicians: Dr. Horsley Drummond, Dr. Alfred Parkin, Dr. George Hall, and Dr. T. M. Allison. Surgeons: Mr. J. Rutherford Morison, Mr. A. M. Martin, Mr. H. B. Angus, and Mr. J. V. W. Rutherford. [illegible] Throat and Ear Department: Surgeon: Mr. G. W. Ridley; Assistant Surgeon: Mr. S. S. Whillis. Gynæcological Department: Dr. R. P. R. Lyle. Skin Department: Physician: Dr. Robert A. Bolam; Assistant Physician: Dr. D. W. Patterson. Orthopædic Department: Mr. A. M. Martin. Electrical Department: Dr. W. D. Arnison. Pathologist: Dr. Stuart McDonald. Bacteriologist: Dr. H. J. Slade. Pathological and Analytical Chemist: Mr. P. P. Bedson, D.Sc. [illegible] Phillips, Dr. H[illegible] Medical Registr[illegible] Gurney. Surgical Registrars: Mr. J. W. Heslop, Mr. J. C. Stewart, Mr. R. J. Willan, Mr. Hamilton Drummond, and Mr. F. C. Pybus.

There are other institutions at which the student of medicine of the University of Durham can receive clinical instruction. Practical Midwifery can be studied at the Newcastle Lying-in Hospital. Instruction is given in Psychological Medicine at the Northumberland County Asylum, Morpeth. A special course of instruction is given in the City Hospital for Infectious Diseases by the Superintendent, [illegible]

Assistant Surgeons: Mr. J. B. Hartley and Mr. Stanley Robson. Honorary Anæsthetists: Dr. O. W. Ogden and Mr. T. H. Livingstone. House Surgeon: Mr. A. E. Burroughs. Matron: Miss C. Crump. Secretary: Mr. Richard Smith, 61, Westgate-road, Newcastle-on-Tyne. Out-patients for 1908, 7437; in-patients, 349.

UNIVERSITY OF BIRMINGHAM.

The University of Birmingham grants the degrees of M.B., Ch.B., M.D., Ch.M., and also a degree and a diploma in Public Health. The course for the Bachelors' degrees extends over five years from the date of registration with the General Medical Council. As a rule the first four of these years must be spent in the University, but the Senate has power of recognising attendance at another University as part of the attendance qualifying for these degrees and of [illegible] other Universities as [illegible] and [illegible]s at [illegible] classes at the University. The fifth year may be spent at any other school or schools of medicine recognised by the

University. The students of the Medical Faculty can be members of the University Club, the University Athletic Club, and the University Officers' Training Corps, while they possess a guild—the Guild of Undergraduates—which is designed to be a recognised medium of communication between the teachers and the taught. The University Medical Society and the Dental Students' Society also offer opportunities of coöperation for mutual benefit.

Degrees of Bachelor of Medicine and Bachelor of Surgery.—The student must have passed either the Matriculation Examination of the University or one of the following examinations. For the present the University will recognise any one of the following examinations, in lieu of its own Matriculation, in the case of medical students, provided always that such examination shall have included the subjects of English, Latin, Mathematics, and any one of the following: Greek, French, German, or any other modern foreign language, together with Chemistry or Experimental Mechanics, or some other branch of Experimental Physics, and that all the subjects have been passed at one examination: (*a*) the previous examination of the University of Cambridge; (*b*) responsions of the University of Oxford; (*c*) the Preliminary or Matriculation Examination of a recognised University; (*d*) the (Higher) Certificate of the Oxford and Cambridge Examinations Board; (*e*) the Oxford or Cambridge Senior Local Examination. A Matriculation Examination will be held on Sept. 13th, 1909, and succeeding days. First Examination.—Chemistry and Physics and Elementary Biology. Second Examination.—Anatomy and Physiology. Third Examination.—Pathology and Bacteriology, Materia Medica and Practical Pharmacy. Fourth Examination (at the end of the fourth year).—Forensic Medicine, Toxicology, and Public Health. Two years' hospital work must have been accomplished. Final Examination.—Medicine, Surgery, Midwifery, Gynæcology, Therapeutics, Mental Diseases, and Ophthalmology. Attendance at a general hospital for a year after the passing of the fourth examination will be required, also attendance at a fever hospital and lunatic asylum. Vaccination instruction must be taken out and courses of Ophthalmology, Medical and Surgical Anatomy, and Operative Surgery.

Degrees of Doctor of Medicine and Master of Surgery.—At the end of one year from the date of having passed the final M.B., Ch.B. examination the candidate will be eligible to present himself for the higher degrees of either Doctor of Medicine or Master of Surgery or both.

Candidates for either of these degrees will be required to comply with the following regulations. Every candidate for the degree of M.D. shall present a thesis embodying observations in some subject embraced in one of the departments of the medical curriculum enumerated below, and in addition he will be required to pass a general examination in Principles and Practice of Medicine. It will be in the power of the Board of Examiners to exempt a candidate whose thesis is of exceptional merit from any part of these examinations.

A thesis may be presented in any of the following departments of study: (*a*) Anatomy, including Comparative Anatomy, (*b*) Physiology, (*c*) Human or Comparative Pathology, (*d*) Bacteriology, (*e*) Pharmacology, (*f*) Therapeutics, (*g*) Medicine, (*h*) Mental Diseases, (*i*) Preventive Medicine or Public Health, (*j*) Toxicology, (*k*) Legal Medicine, (*l*) Midwifery.

Candidates for the degree of Ch.M. are required to comply with the following regulations:—At the end of one year from the date of having passed the final M.B., Ch.B. Examination candidates will be eligible to present themselves for the higher degree of Master of Surgery. Candidates for this degree will be required to comply with the following regulations: 1. Every candidate shall present a thesis, embodying observations in some subject embraced in one of the departments of the medical curriculum enumerated below; in addition the candidates will be required to pass a general examination in Principles and Practice of Surgery and to perform operations on the cadaver. 2. It will be in the power of the board of examiners to exempt a candidate whose thesis is of exceptional merit from any part of these examinations. 3. The candidate may be examined in that department of the medical curriculum from which the subject of his thesis is chosen and the examiners may require to see the notes of original observations on which the thesis is based, (*a*) Surgery, (*b*) Pathology, (*c*) Bacteriology, (*d*) Gynæcology, (*e*) Ophthalmology.

Degree in Public Health.—For the regulations for this degree and for the diploma in the same subject see p. 667.

Fees.—Matriculation, £2; First Examination, £2; Second Examination, £2; Third Examination, £2; Fourth Examination, £2; Final Examination, £8; M.D. or Ch.M., £10.

Professors—Physics: J H. Poynting, Sc.D., F.R.S. Chemistry: P. H. Frankland, Ph.D., F.R.S. Elementary Biology: (vacant). Medicine: R. Saundby, M.D., and A. H. Carter, M.D. Surgery: G. Barling, F.R.C.S., and Jordan Lloyd, F.R.C.S. Anatomy: A. Robinson, M.D. Physiology: E. W. Wace Carlier, M.D. Therapeutics: A. Foxwell, M.D. Forensic Medicine: J. T. J. Morrison, F.R.C.S. Hygiene and Public Health: A. Bostock Hill, M.D. Midwifery: E. Malins, M.D. Gynæcology: J. W. Taylor, F.R.C.S. Pathology: R. F C. Leith, F.R.C.P. Edin Lunacy and Mental Disease: E. B. Whitcombe, M.B. Ophthalmology: Priestley Smith, F.R.C.S.

At the University of Birmingh [illegible] larships are awarded:—(*a*) Myers [illegible] of £150, tenable for one year, awarded by vote of committee to M.B., Ch.B. Birm., B.Sc. candidates, tenable at one of certain German universities; (*b*) Ingleby Scholarship of £10, tenable for one year, awarded to the candidate at Final Examination obtaining highest "first-class" marks in the subjects of Midwifery and Gynæcology; (*c*) Sydenham Scholarship of £42, tenable for three years, award of Coun to orphan sons of medical practitioners; (*d*) Sands C Scholarship of £42, tenable for three years, awarded to t candidate, not being more than 19 years of age, taking t highest marks at the June Matriculation; (*e*) Dental Schola ship of £37 10*s*., tenable for three years, Open Competiti Examination in subjects learned during apprenticeship; ((*g*), (*h*), and (*i*) Four Queen's Scholarships of £10 10*s*. eac awarded to candidates taking highest "first-class" marks Second, Third, Fourth, and Final M.B. Examinations; a (*j*) George Henry Marshall Scholarship of £10, award annually, for the encouragement of Research Work Ophthalmology.

Clinical Instruction.—The medical students of the Un versity receive their clinical instruction by attending t amalgamated practice of the General Hospital and t Queen's Hospital, details of which follow.

The clinical instruction of the Birmingham medic students is carried on under the direction of the Birmingha Clinical Board. The hospitals present an excellent field f clinical work, possessing more than 500 beds, treating ann ally 8000 in-patients and 100,000 out-patients. The student spend part of their curriculum in each hospital, and th have every opportunity of acquiring a varied, full, and prac tical knowledge of their professional work. The curriculu is adapted in the first place to meet the needs of the student of the University of Birmingham, but it is also well adapted t the requirements of students preparing for the examination of all other universities and licensing bodies. At the Genera Hospital there are open to the students the following appointments: A resident medical officer, elected annually (£70); a resident surgical officer, elected annually and eligible fo re-election for three years (£100); a resident pathologist, elected for six months (£50); three surgical casualty officers, elected annually and eligible for re-election (£50); three house physicians and four house surgeons hold office for six months, receiving board, residence, and salaries at the rate of £50 a year; one house surgeon to the gynæcological, ophthalmic, and aural departments is elected every six months, receiving board, residence, and a salary of £50 a year; two assistant house surgeons are elected every three months, receiving board, residence, and salaries at the rate of £40 a year; a resident medical officer at the Jaffray Hospital, who is elected annually but is eligible for re-election, and who receives £150 a year; and a resident medical assistant at this hospital, who is not necessarily qualified, is provided with board and residence, and holds office for three months. At the Queen's Hospital there are open to the student the following appointments: Three house physicians, three house surgeons, and one obstetric and ophthalmic house surgeon, who hold office for six months and have salaries at the rate of £50 a year. Thirty-eight other appointments of varying value are at the City Workhouse and Workhouse Infirmary, at the Birmingham General and Branch Dispensaries, at the Birmingham Lunatic Asylums, at the City Fever Hospitals, at the Children's Hospital, at the Birmingham and Midland Eye Hospital, at the Orthopædic and Spinal Hospital, at the Maternity Hospital, and at the Ear and Throat Hospital.

THE BIRMINGHAM GENERAL HOSPITAL.—The General Hospital contains 349 beds, and of these 327 are in daily use, upwards of 5000 in-patients passing through the wards yearly. There are special wards for children, for gynæcological, septic and infectious cases, and special beds are reserved for eye, ear, and skin cases. Some 60,000 out-patients are treated there annually. The post-mortem department is in a separate building. It consists of a mortuary with a small chapel, a post-mortem room proper, and laboratories for bacteriology and morbid histology. In addition there are separate rooms in the main building, adjoining the various medical and surgical wards, for clinical pathology and these are under the direction of special officers. There are four operating theatres, all designed and fitted on the most modern lines. In connexion with the hospital is the Jaffray Suburban Hospital of 52 beds at Gravelly Hill. The arrangements for clinical teaching at this hospital are very thorough. In addition to the clinical teaching given in the wards and out-patient department by the honorary staff medical and surgical tutorial classes are held for senior and junior students, while [illegible] departments by [illegible]

Staff of Gen[illegible] Walter Foster. [illegible] Malins. Physi[illegible] M. Simon, Dr. [illegible] Short. Surgeons: Sir Thomas F. Chavasse, Mr. Gilbert Barling, Mr. William F. Haslam, and Mr. George Heaton. Obstetric Physician: Dr. Thomas Wilson. Ophthalmic Surgeon: Dr. D. C. Lloyd-Owen. Aural Surgeon and Laryngologist: Dr. F. W. Foxcroft. Physician in Charge of Skin Department: Dr. A. Douglas Heath. Assistant Physicians: Dr. James W. Russell and Dr. A. Stanley Barnes, Dr. William H. Wynn and Dr. J. E. H. Sawyer. Assistant Surgeons: Mr. Albert Lucas, Mr. Leonard P. Gamgee, Mr. F. Victor Milward, and Mr. Frank Barnes. Assistant Obstetric Officer: Mr. H. B. Whitehouse, F.R.C.S. Visiting Pathologist: (vacant). Anæsthetists: Dr. Sydney Haynes and Dr. W. J. McCardie. Surgical Photographer and Radiographer: Mr. J. Hall Edwards. Dental Surgeon: Mr. A. T. Hilder.

THE QUEEN'S HOSPITAL.—Similar arrangements for clinical teaching are made here, and the material also is excellent. Ward and tutorial classes are regularly conducted by the staff, there are daily clinics in the out-patient department, while teaching duties are definitely assigned to the house physicians and house surgeons. There are also special [illegible]

[illegible] Mr. Priestley Smith. Physicians: Dr. Arthur Foxwell, Dr. O. J. Kauffmann, and Dr. J. Douglas Stanley. Surgeons: Mr. Jordan Lloyd, Mr. J. T. J. Morrison, and Mr. C. A. Leedham-Green. Ophthalmic Surgeon: Mr. Wilfrid Allport. Obstetric Physician: Dr. C. E. Purslow. Physicians for Out-patients: Dr. J. G. Emanuel and Dr. L. G. J. Mackey. Surgeons for Out-patients: Mr. W. Billington, Mr. A. W. Nuthall, and Mr. B. J. Ward. Pathologist: Dr. L. G. J. Mackey. Radiographer: Mr. F. Emerys-Jones.

BIRMINGHAM AND MIDLAND EYE HOSPITAL, Church-street, Birmingham.—Honorary Consulting Physician: Dr. R. Saundby. Honorary Consulting Surgeon: Mr. D. C. Lloyd-Owen. Surgeons: Mr. H. Eales, Mr. E. W. Wood-White, and Mr. J. Jameson Evans. Dental Surgeon: W. Madin, B.D.S. Anæsthetist: Dr. S. W. Haynes. This hospital possesses 105 beds, and there is an average daily attendance of out-patients of 217. This institution is recognised by Universities and the Royal College of Surgeons, England, and Royal College of Physicians, London, as an ophthalmic hospital at which clinical instruction in ophthalmology may be received. Students attending for a period of three months will be granted certificates which will qualify for the University and Conjoint Board examinations.

UNIVERSITY OF LIVERPOOL.

The student must pass either (1) the University Matricula[illegible] (2) [illegible] Gradua[illegible] or [illegible] of London, or (4) the Higher Certificate Examination of Oxford and Cambridge Joint Board, or (5) the Senior Local Examination of Oxford or Cambridge, or (6) some other examination of equal standard accepted by the Joint Matriculation Board. [illegible] sequent to passing t[illegible] r of [illegible] ctor [illegible] of

Surgery.—Candidates for the degrees of Bachelor of Medicine and of Surgery must have attained the age of 21 years on the day of graduation. At least two of the five years of medical study must have been passed in the University, and one year at least must have been passed in the University subsequently to the date of passing the First Examination. The other three years may be passed at any college or m[illegible] University. [illegible] respectively: the First Examination, the Second Examination, and the Final Examination. The fee is £5 for each examination. The subjects of the First Examination are: (1) Chemistry, Inorganic and Organic; (2) Biology (Zoology and Botany); and (3) Physics. The examination is divided into two parts—namely, (1) chemistry and physics, and (2) biology; and candidates may pass in these parts separately. The subjects of the Second Examination are (*a*) Anatomy and Physiology (including Physiological Chemistry and Histology), and (*b*) Materia Medica, Pharmacy, and Pharmacology. Candidates may pass in *a* or *b* separately. The subjects for the Final Examination are (1) General Path[illegible] (2) T[illegible]rapeutics; (3) Forensic [illegible] Health; (4) Obstetrics [illegible]y, Systematic, Clinical, and Practical; and (6) Medicine, Systematic, and Clinical, including Mental Diseases and Diseases of Children. The Final Examination is divided into three parts, the first consisting of subject (1), the second of subjects (2) and (3) the third of subjects (4), (5), and (6). Candidates may pass in these parts separately. Candidates for the third part must have completed the fifth year of medical study.

Degrees of Doctor of Medicine and Master of Surgery.—No candidate will be admitted to the degrees of Doctor of Medicine or Master of Surgery unless he has previously received the Degrees of Bachelor of Medicine and Bachelor of Surgery, and at least one year has elapsed since he passed the examinations for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation embodying the results of personal observations or original research, either in some department of medicine or of some science directly relative to medicine: provided always that original work published in scientific journals or separately shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree. No candidate shall be admitted to the degree unless his application after report from the Faculty of Medicine shall have been accepted by the Senate. Candidates may be required to undergo examination in any subject connected with the dissertation. The subjects of examination for the degree of Master of Surgery are (1) Surgical Anatomy, (2) Surgery, (3) Operative Surgery, (4) Clinical Surgery, (5) Ophthalmology, and (6) Pathology and Bacteriology.

Professors—Physiology: C. S. Sherrington, M.D., F.R.S. Physics: L. R. Wilberforce, M.A. Chemistry: J. Campbell Brown, D.Sc. Natural History: W. A. Herdman, D.Sc., F.R.S. *Botany: R. J. H. Gibson, M.A. Anatomy*: A. Melville Paterson, M.D. Medicine: T. Robinson Glynn, M.D. Surgery: Rushton Parker, F.R.C.S. Pathology: Sir Rubert Boyce, M.B., F.R.S. Midwifery and Gynæcology: H. Briggs, M.D. Therapeutics: J. H. Abram, M.D. Hygiene: E. W. Hope, D.Sc. Forensic Medicine: R. J. M. Buchanan, M.D. Tropical Medicine: Major Ronald Ross, C.B., F.R.S. Bio-Chemistry: B. Moore, D.Sc. Comparative Pathology: H. E. Annett, M.D.

At this University the following Scholarships and Fellow[illegible] Joint Matriculation Board Examination held in July, open to First M.B. Course Students; (*c*) Lyon Jones Scholarship, No. 1, of £21 per annum, tenable for two years, Competitive Examination *among Junior* Students in First M.B. Subjects, Perpetual Course at the University; (*d*) Lyon Jones [illegible] students; (*f*) Unive [illegible] £25 for one year, awarded on results of [illegible] for the degrees; (*g*) Holt Fellowships, Physiology and Pathology, of £100 each, for one year; this and the following six Fellowships are awarded by vote of Faculty to Student after graduation, for Teaching and Original Research; (*h*) Gee Fellowship, Anatomy, of £100, for one year, for Teaching and Research; (*i*) Alexander Fellowship, Pathology, of £100, for one year, for Research in Pathology, as are also the following four Fellowships; (*j*) Johnston Colonial Fellowship, Pathology and Bacteriology, of £100, for one year; (*k*) John W. Garrett International Fellowship, Physiology and Pathology, of £100, for one year; (*l*) Thelwall Thomas Fellowship, Surgical Pathology, of £100, for one year; (*m*) Ethel Boyce Fellowship in Gynæcological Pathology, of £100, for one year; the last two are awarded by vote of Faculty to graduate, and are for Research.

Medical School Buildings.—Spacious and well-equipped class-rooms and laboratories have been erected for the practical study of all the important scientific subjects which form the basis of medicine. Medical research has also been endowed with several new laboratories in which students can pursue research work after graduation. All the laboratories and class-rooms are situated close together, communicating with one another, and are made up of four large blocks of buildings which form one side of the College quadrangle. The most recent additions are the Johnston Laboratories for Experimental Medicine, Bio-chemistry, and Comparative Pathology and the new building for Anatomy, Surgery, Toxicology, Ophthalmology and Dental subjects. The departments of Physiology and Pathology are accommodated in the large block provided by the generosity of the late Rev. S. A. Thompson Yates in 1898. The Anatomical department is situated in a separate block and has a complete suite of rooms, including a large and well-stocked museum and a well-lighted dissecting room on the upper floor measuring 70 by 40 feet.

Fellowships and Scholarships.—Fellowships, scholarships, and prizes of over £1000 are awarded annually. A Holt Fellowship in Pathology and Surgery of the value of £100 for one year is awarded annually by the Medical Faculty to a senior student possessing a medical qualification. The successful candidate is required to devote a year to tutorial work and investigation in the pathological department. A Holt Fellowship in Physiology, awarded under similar conditions of the value of £100 for one year. A Robert Gee Fellowship in Anatomy, awarded under similar conditions, also of the value of £100 for one year. An Alexander Fellowship for Research in Pathology of the annual value of £100, renewable. A Johnston Colonial Fellowship in Pathology and Bacteriology (£100 a year, renewable). A John W. Garrett International Fellowship in Physiology and Pathology (£100 a year, renewable). An Ethel Boyce Fellowship in Gynæcological Pathology (£100 a year, renewable). A Thelwall Thomas Fellowship (£100 a year, renewable) in Surgical Pathology. Two Lyon Jones Scholarships of the value of £21 each for two years are awarded annually—a Junior Scholarship, open at the end of the first year of study to Liverpool University students, on the subjects of the First M.B. Examinations, and a Senior Scholarship, open to all students in the school at the end of the second or third year of study, on the subjects of Anatomy, Physiology, and Therapeutics. A University Scholarship of £25 awarded on the results of the second examination for the degree. The Derby Exhibition of £15 for one year is awarded in Clinical Medicine and Surgery in alternate years. Students may compete in their fourth and fifth years. A Clinical School Exhibition of £15 for one year awarded under similar conditions. The Torr Gold Medal in Anatomy, the George Holt medal in Physiology, the Kanthack Medal in Pathology, the Robert Gee Book Prize, of the value of £5, for Children's Diseases. Two Robert Gee Entrance Scholarships of the value each of £25 per annum for two years are offered annually for competition. The holder is required to take out the Course for the University Degrees in Medicine. Communications should be addressed to the Dean, Mr. K. W. Monsarrat, The University, Liverpool.

Clinical Instruction.—The Clinical School of the University now consists of four general hospitals—the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital; and of five special hospitals—the Eye and Ear Infirmary, the Hospital for Women, the Infirmary for Children, St. Paul's Eye and Ear Hospital, and St. George's Hospital for Skin Diseases. These hospitals contain in all a total of 1127 beds. The organisation of these hospitals to form one teaching institution provides the medical student and the medical practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom. All the hospitals are within easy access from the University; those which are situated at any distance are readily reached by the tramway service of the city. The period of hospital practice extends over the last three years of medical study. During the first two years of this period no student will be permitted to change his attendance from one general hospital to another except at the commencement of an academic term. It is a regulation of the school that not more than five of the six terms of these two years shall be spent at any single general hospital. During the final year of hospital practice a student is permitted to attend the practice of all the general hospitals without restriction. The regulations demand only that his attendance shall be regular and to the satisfaction of the Hospitals' Board. There are a large number of appointments to house physicianships and surgeonships both at the general and special hospitals which are open to qualified students of the school. These appointments (20) in most cases carry salaries ranging from £60 to £100 per annum. Applications for further information regarding the Medical Curriculum should be addressed to the Dean of the Faculty of Medicine.

School of Veterinary Medicine.—A school of Veterinary Medicine in connexion with the University was opened in October, 1904; full courses of instruction for the Veterinary Curriculum will be provided and students will be prepared for the M.R.C.V.S. A diploma in Veterinary Hygiene is now granted by the University.

Public Health Department.—This is located in a separate building known as Ashton Hall in which full courses of instruction are given to D.P.H. students for the D.P.H. of the University and the diplomas of other Examining Boards (see p. 667).

Special Diplomas.—The [illegible] in Anatomy, Bacteriology, [illegible] A special course of study of three terms' duration is required in the subject chosen for the diploma and allied subjects.

School of Pharmacy.—Complete courses of instruction are provided adapted to the requirements of candidates preparing for either the Minor or Major Examinations of the Pharmaceutical Society of Great Britain.

Prospectuses and further information may be had on application to the Dean of the Faculty of Medicine, University of Liverpool.

Royal Infirmary Staff.—Consulting Physicians: Dr. A. T. H. Waters, Dr. T. R. Glynn, and Dr. R. Caton. Physicians: Sir James Barr, M.D., Dr. T. R. Bradshaw, and Dr. J. H. Abram. Assistant Physicians: Dr. R. J. M. Buchanan and Dr. John Hay. Consulting Surgeon: Mr. R. Parker. Surgeons: Mr. F. T. Paul, Mr R. A. Bickersteth, and Mr. W. T. Thomas. Assistant Surgeons: Mr. T. C. Littler-Jones and Mr. R. E. Kelly. Gynæcological Surgeon: Mr. T. B. Grimsdale. Assistant Gynæcological Surgeon: Mr. W. B. Bell. Ophthalmic Surgeon: Mr. T. H. Bickerton. Surgeon to the Throat Department: Mr. J. M. Hunt. Physician to the Skin Department: Dr. L. Roberts. Dental Surgeon: Mr. E. J. M. Phillips. Pathologists: Sir R. W. Boyce and Dr. E. Glynn. Anæsthetists: Mr. W. Fingland, Mr. F. W. Bailey, Mr. H. Armstrong, and Mr. A. J. O'Leary.

David Lewis Northern Hospital Staff.—Physicians: Dr. T. Bushby and Dr. W. B. Warrington. Consulting Surgeons: Mr. W. M. Campbell and Mr. C. Puzey. Surgeons: Mr. D. Harrison, Mr. R. W. Murray and Mr. K. W. Monsarrat. Consulting Ophthalmic Surgeon: Mr. A. N. Walker. Surgeon to the Orthopædic Department: Mr. E. Broad. Dental Surgeon: Mr. W. Matthews. Pathologists: Dr. H. L. Murray and Dr. J. Owen. Bacteriologist: Dr. C. A. Hill. Anæsthetists: Mr. G. B. Robinson, Mr. R. Stevenson, and Mr. V. C. de Boinville. Medical Tutor: Dr. P. Hick. Surgical Tutor: Mr. T. St. J. Barry.

Royal Southern Hospital Staff.—Consulting Physicians: Dr. W. Williams and Dr. William Carter. Consulting Surgeon: Mr. R. Hamilton. Physicians: Dr. J. W. Macalister, Dr. J. L. Roberts, and Professor Ronald Ross. Surgeons: Dr. W. Alexander, Mr. R. Jones, and Mr. G. P. Newbolt. Physician to the Skin Department: Dr. F. H. Barendt.

Consulting Ophthalmic Surgeon: Mr. R. Williams. Con- [illegible] Medical [illegible] sulting [illegible] newan. [illegible] Mr. J [illegible] F. M. Gardner-Medwin, and Dr. S. A. Smith.

Stanley Hospital Staff.—Consulting Physicians: Dr. R. J. Richardson and Dr. W. [illegible] Mr. J. Bark and Mr. K. [illegible] A. G. Gullan and Dr. J [illegible] Larkin and Mr. D. [illegible] Physician: Dr. J. Grimsl [illegible] McDougall. Dentist: Mr. J. P. Roberts.

School of Tropical Medicine.—The school is affiliated with the University of Liverpool and the Royal Southern Hospital of Liverpool. Three courses of instruction are given every year. Two of these last for three full months and are called respectively the Lent Course, from Jan. 6th to April 5th; and the Autumn Course, from Sept. 15th to Dec. 13th. The Third Course, called the Short Course, lasts one month, from June 1st to the 30th. The full course consists (1) of a systematic series of lectures on [illegible] the Professor [illegible] of additional [illegible] pecial Indian Diseases, deli [illegible] (3) of systematic lectures and [illegible] Pathology and Parasitology [illegible] Lecturer at the University; (4) of similar instruction on Medical Entomology by the Lecturer on Economic Entomology at the University; (5) of Practical Work on the Bacteriology of T [illegible] the [illegible] clin [illegible] Royal Southern Hospital by the Physician in charge of the Tropical Ward, the Professor, and the Walter Myers Lecturer. The instruction given occupies six hours a day for five days a week during the course. Teaching under headings 3, 4, and 5 above is delivered in the laboratory of the school at the University, which contains accommodation for 30 students, with all necessary appurtenances, including a well equipped museum, a class library, and access to [illegible] library. Teaching under heading [illegible] ward and the attached clinical [illegible] Southern Hospital on two or three afternoons a week. At the end of each course an examination is held by the University for its diploma of Tropical Medicine (D.T.M.), which is open only [illegible] course of instruction of [illegible] three days and consists [illegible] edicine, Tropical Pathology, and Tropical Sanitation and Entomology respectively; (2) of a clinical examination; and (3) of an oral examina- [illegible] for the ful [illegible] extra char [illegible] required. [illegible] cations sho [illegible] University of Liverpool, from whom prospectuses may be obtained. Two University Fellowships of £100 a year each are open to students of the school, amongst others. Accommodation for research work is to be had both at the University Laboratory of the school and at its Research Laboratories at Runcorn (16 miles distant from Liverpool). Since it was instituted nine years ago the school has employed 25 different investigators paid out of its funds and has despatched to the tropics 21 scientific expeditions, many of the workers ha [illegible] dents. The work done by [illegible] al memoirs with many p [illegible] books and numerous arti [illegible] 1906 the [illegible] the "Annals of Tropical [illegible] ished by the Committee [illegible] (apply to the Secretary, [illegible] ol). The Mary Kingsley [illegible] for distinguished work in [illegible] e, and has been given to Sir David Bruce, Professor Koch, Dr. Laveran, and Sir Patrick Manson.

THE VICTORIA UNIVERSITY OF MANCHESTER.

Four degrees in Medicine and Surgery are conferred by the University—viz., Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

All candidates for degrees in Medicine and Surgery are required to pass an examination called the Matriculation Examination (Faculty of Medicine), or to have passed such other examination as may be recognised by the University for this purpose.[2]

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Before admission to the degree of M.B. or Ch.B. candidates are required to present certificates that they will have attained the age of 21 years on the day of graduation and that they have pursued the courses of study required by the University Regulations during a period of not less than five years subsequently to the date of their registration by the General Medical Council, two of such years having been passed in the University and one year at least having been passed in the University subsequently to the date of passing the First M.B. Examination. All candidates for the degrees of Bachelor of Medicine and Bachelor of Surgery are required to satisfy the examiners in the several subjects of the following examinations: the First Examination, the Second Examination, the Third Examination, and the Final Examination.

The First Examination.—The subjects of examination are as follows:—(1) Inorganic Chemistry and Physics; (2) Biology; and (3) Elementary Organic Chemistry and Bio-Chemistry. Candidates must have attended during at least one year courses both of lectures and of laboratory [illegible] are as follows:—(1) Anatomy; (2) Physiology, including [illegible] istology. Candidates may pass [illegible] cology and Therapeutics; (3) [illegible] ons. [illegible] of examination are [illegible] and Clinical (in- [illegible] (2) Sur- [illegible] trics and [illegible] Forensic [illegible] may be taken separately under certain conditions.

Candidates for the Final Examination must have completed the fifth year of medical study.

Degree of Doctor of Medicine.—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates may elect either (1) to present an original dissertation; or (2) to undergo an examination. The dissertation must embody the results of personal observation or original research, either in some department of medicine or of some science directly relative to medicine. The examination, which will be partly written, partly practical, is in the Principles and Practi [illegible] in some other subject to [illegible]

Degree of Master of [illegible] ible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. The subjects of examination are as follows: (1) Surgical Anatomy; (2) Surgery; (3) Operative Surgery; (4) Clinical Surgery; (5) Ophthalmology; and (6) Pathology and Bacteriology.

Professors—Physics: E. Rutherford, D.Sc., F.R.S. Chemistry: H. B. Dixon, M.A., F.R.S. Organic Chemistry: W. H. Perkin, D.Sc., F.R.S. Zoology: S. J. Hickson, D.Sc., F.R.S. Botany: F. E. Weiss, D.Sc.

---

[2] [illegible] exemption from the Matriculation Examina- [illegible]

Physiology: W. Stirling, D.Sc. Anatomy: Grafton Elliot Smith, M.A., M.D., F.R.S. Materia Medica: R. B. Wild, M.D. Comparative Pathology and Bacteriology: A. S. Delépine, M.Sc. Pathology: J. Lorrain Smith, M.D. Clinical Medicine: Graham Steell, M.D. Systematic Medicine: George R. Murray, M.A., M.D. Systematic Surgery: G. A. Wright, M.B., F.R.C.S. Clinical Surgery: F. A. Southam, M.B., F.R.C.S. Obstetrics and Gynæcology: Sir W. J. Sinclair, M.D. Forensic Medicine: J. Dixon Mann, M.D.

Communications should be addressed to the Registrar, The University, Manchester.

Scholarships, Fellowships, and Prizes.—At this University there are 22 Foundation Scholarships, 12 Exhibitions, five being for subjects connected with medical study, a Surgical Prize, a Fellowship, Research Fellowships in Public Health, and Honorary Research Fellowships. 13 Scholarships are Entrance Scholarships, three are Medical, and there are one each for Surgery, Biology, Physiology, and Diseases of Children, and one General Medical and Surgical. Three of the Exhibitions are for Physiology, one for Anatomy, and one for French and German. The Surgical Prize, named "The Dumville," is awarded for the subjects of Systematic, Practical, and Operative Surgery, Surgical Anatomy, and Surgical Pathology, £15. The Leech Fellowship is awarded annually for excellence and promise in one or more of the subjects of the Second or Final M.B. Examination (£100) and the Honorary Research Fellowships, tenable for two years, conferring the right of free use of the laboratories, are awarded generally in October on application, with evidence of capacity for independent investigation.

The following entrance scholarships are offered for award to persons of either sex proposing to enter a medical course of study at the University:—Seaton—One of £40, tenable for two years. Subjects: Greek and Latin Translation at sight, and Prose Composition. Credit given for knowledge of Mathematics (Geometry and Algebra); Elements of English Language, Literature, and History; French and German. Rogers.—One of £40, tenable for two years. Subjects as in Seaton. Dalton.—Two of £40, tenable for two years. Subjects: Geometry (Euclid I.—IV., and VI., or the subjects thereof); Algebra (as far as the Binomial Theorem, inclusive), Plane Trigonometry (to Solution of Triangles); Elementary Analytical Geometry; Conic Sections. Credit given for knowledge of Classics, Elements of English Language, Literature, and History; French and German. Cartwright.—£35 per annum, tenable for three years. Subjects as in Dalton. Dreschfeld Memorial—£30, tenable for one year. Subjects: those of July Matriculation Examination. Hulme.—£35, tenable for three years. Subjects: English Language (Grammatical Structure and Outlines of its History); English Literature (an essay on some subject of English literature); and Modern History (Outlines of English History and Geography); with at least two of the following: Latin (Translation at sight, Grammar, and Easy Composition); Greek (ditto); French (ditto); German (ditto). Credit given for knowledge of Mathematics (Geometry and Algebra). Dora Muir.—£25 per annum, tenable for three years (open to women only). Candidates may select such of the subjects as they desire from amongst those set for the other Entrance Scholarships. James Gaskill.—£35, tenable for two years. Subjects: Mathematics, Geometry (the substance of Euclid I.—IV. and VI.), Algebra (as far as the Binomial Theorem, inclusive), Plane Trigonometry (to Solution of Triangles), Elementary Mechanics, Chemistry. Credit given for knowledge of Classics, Elements of English Language, Literature, History, and French and German. Manchester Grammar School.—£25 per annum, tenable for three years. The examinations for all these scholarships are held in the month of May. Kay-Shuttleworth (Sir James Phillips).—£30 per annum, tenable for three years. Subjects: Mathematics, Elementary Mechanics, Chemistry. Entrance Scholarships in Medicine.—One Scholarship in each year will be offered for proficiency in Arts or Science. The Scholarships are of the value of £100 each, which will be set off against fees as follows: £60 against the University fees and £40 against the Infirmary fees.

The Platt Biological Scholarship of £50 for one year is awarded to the candidate who shows the most promise of ability for prosecuting original search in Zoology and Botany, and the holder is to devote his time to research in Zoology or Botany. The Robert Platt Physiological Scholarship of £50 for two years, with the subjects of Physiology and Comparative Anatomy, is open to candidates whether or not previously students of the University. There are two Dauntesey Medical Scholarships of £35 each for one year, with the subjects of Zoology, Botany, and Chemistry. These Scholarships are open to all students preparing for a medical course who shall not have attended lectures or laboratory courses on Human Anatomy or Physiology, or a purely medical or surgical course in the University or in any other medical school in the United Kingdom. Candidates must not be more than 25 years of age on Oct. 1st of the year of competition. Scholars must immediately on election enter for a full course of medical studies. The Turner Scholarship of £20 for students who have completed a full course of medical study in the University has the following subjects: Medicine, Pathology (written and practical), Obstetrics, Practical Surgery, Ophthalmology, Forensic Medicine, and Public Health. The John Henry Agnew Scholarship of £30 is awarded on the results of an examination, partly written and partly clinical, on Diseases of Children, Medical and Surgical, and is open for competition annually to all students in the medical department who have pursued a regular course of medical study in the University extending over a period of not less than four years or more than six years, and who have attended the course of lectures on Diseases of Children. The Ashby Memorial Scholarship, value £100, is open to duly qualified medical men and women who intend to pursue research in diseases of children.

The Professor Tom Jones Memorial Surgical Scholarship of £100 for one year is awarded to the candidate elected on the result of evidence submitted by him, and he must have either graduated in the University or have obtained the Diploma of the Conjoint Colleges. The Graduate Scholarship in Medicine of the value of £25 to £50 for one year is awarded on the results of the Second Examination for M.B., Ch.B. The Theodores Exhibition of £15 for one year has the subjects of French and German, and the successful candidate is required to enter for a regular University course. There are two Robert Platt Exhibitions of £15 each for first and second-year students in physiology, and the Sydney Renshaw Exhibition of £15 is for second-year students in physiology. The Professor Tom Jones Exhibition in Anatomy, value £25, is for first-year students in anatomy. The Dumville Surgical Prize of £15 is awarded after examination in Systematic, Practical and Operative Surgery, Surgical Anatomy, and Surgical Pathology. A gold medal is awarded for distinction on obtaining the degree of M.D.

The Medical School.—This medical school is located in a large building, which forms a part of the University. It is provided with large dissecting-rooms, physiological laboratories, private laboratories, and work-rooms, besides lecture-rooms, a museum, and a library. In order to give the fullest possible opportunities for teaching and investigation in the departments of Anatomy, Physiology, Pathology, and Materia Medica, a large extension of the school buildings was made in 1895. The greater part of the new buildings is devoted to the departments of physiology, pathology, toxicology, anatomy, and public health. The physiological department occupies more than half of the new buildings, and includes a large lecture theatre, accommodating 350 students, with preparation and diagram rooms adjacent to it, and a research laboratory fitted with the necessary apparatus for the use of advanced students, research scholars, or practitioners of medicine undertaking the investigation of some special subject. In the new pathological laboratories ample provision is made for the teaching of pathology and bacteriology and for the prosecution of original research. In the toxicological department there is a large laboratory, capable of accommodating 50 students, completely lighted from both sides and also from the roof, equipped with all that is necessary for the practical teaching of toxicology; also a small laboratory for private research, containing the apparatus and fittings necessary for investigations in toxicological chemistry. In the public health department suitable laboratory accommodation is provided for the study of sanitary chemistry, physics, and practical bacteriology in the departments of chemistry and physics and in that of pathology. A large room is provided in the new buildings for a museum of apparatus, models, plans, and other sanitary appliances for the practical instruction of students, together with a special library of works on State medicine, hygiene, vital statistics, and sanitary engineering. In addition, a large lecture theatre for general purposes, [illegible] s, has been provided, and the [illegible] students is supplemented by the [illegible] room.

[illegible] linical and practical departments of medical study are taught partly in the Medical School and partly in the Royal Infirmary, as well as in a fever hospital, a lunatic asylum, and a convalescent home. Medical and Surgical Clinical Classes are conducted in the Infirmary, which in the new buildings together with the associated hospitals at Cheadle will contain 1158 beds, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis, in Obstetric Medicine, Ophthalmic Surgery, and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary.

Public Health.—The regulations with regard to the Degrees in Sanitary Science will be found under the special section on p. 667.

Clinical Instruction.—THE MANCHESTER ROYAL INFIRMARY.—The New Royal Infirmary has been built on the pavilion system, near the University, between the recently enlarged Eye Hospital and the new St. Mary's Hospital for Women and Children, and has accommodation for 592 beds. Of these 52 are allotted to the Special and Emergency Departments; the 540 remaining beds are allocated as follows: 240 for medical practice and 300 for surgical practice (180 for men and 120 for women and children). The medical side consists of five units, each unit having a testing room for the scientific investigation of morbid products and a class-room. The surgical beds are also arranged in five units, each unit having its own operation theatre, with anæsthetising, recovery, sterilising, testing, and apparatus rooms, and its own class-room attached. Of these units four on each side are already occupied. The fine educational block provides very handsomely for the wants and comforts of the students, there being separate suites of rooms for the men and the women, and also a large common reading room, a lecture theatre, and a museum. The present annual average number of in-patients is 7000, of out- and home-patients 27,000, and the list of casualties in the accident room has averaged 18 000 per annum. About 5000 operations are performed annually in the operation [illegible] vales- [illegible]) the [illegible] th its [illegible] con- [illegible] ment.

Women students are admitted to the practice of the Infirmary *on the same terms as men.*

Fees.—Medical Practice: Three months, 5 guineas; six months, 8 guineas; 12 months, 12 guineas; full period required by the Examining Boards, 25 guineas.

In addition to the list of scholarships given under the general heading, "*The Victoria University of Manchester*," two Entrance Scholarships in Medicine of the value of £100 each are offered annually by the Council of the Manchester University and the Medical Board of the Manchester Royal Infirmary for proficiency in Arts and Science subjects respectively. The Bradley Memorial Scholarship in Clinical Surgery, value £20, is offered annually in the Summer Session. Gentlemen are eligible who are in their fifth or sixth year of study, have com- [illegible] years in clinical [illegible] One Medical and [illegible] of 6 guineas are offered annually. (The other scholarships and prizes are in the College Syllabus.) Annual appointments may be held by those who have attended the practice of the infirmary: a Surgical Registrar (£80); a Pathological Registrar (£100); a Medical Registrar (£70); a Surgical Tutor (£30); a Director and an Assistant Director of the Clinical Laboratory (£200 and £40); an Assistant Medical Officer (£105); Three Assistant Surgical Officers (£35 each); Five Anæsthetists (£50); a Medical Officer for home patients (£150); and a Medical Officer for Radiography and Electricity Department (£100). [illegible] annually: [illegible] gical Offi[illegible] valescent [illegible] Officer at this hospital is appointed every six months at a salary of £80 per annum. The following unpaid appointments are open to those who have attended the practice of the Infirmary:—House Surgeons: Two Senior and Two Junior House Surgeons are appointed every three months for a term of six months. *House Physicians*: Ten House Physicians are appointed during each year for a term of six months. Also every six months officers are appointed to the Accident Room, the Gynæcological, and the Ear and Throat Departments. The House Surgeons and House Physicians and Resident Assistant at Cheadle must possess registrable qualifications. Consulting Physician: Dr. Henry Simpson. Physicians: Dr. Graham Steell, Dr. Judson S. Bury, Dr. A. T. Wilkinson, Dr. E. S. Reynolds, and Dr. G. R. Murray. Assistant Physicians: Dr. R. T. Williamson, Dr. E. M. Brockbank, and Dr. E. N. Cunliffe. Pathologist: Dr. J. Lorrain Smith. Consulting Surgeon: Mr. Walter Whitehead. Surgeons: Mr. F. A. Southam, Mr. G. A. Wright, Mr. W. Thorburn and Mr. J. E. Platt. Assistant Surgeons: Mr. J. W. Smith, Mr. A. H. Burgess, Mr. J. H. Ray, and Mr. E. D. Telford. Anæsthetist: Mr. Alexander Wilson. Consulting Obstetric Physician: Dr. Lloyd Roberts. Gynæcological Surgeon: Dr. A. Donald. Assistant Gynæcological Surgeon: Dr. W. E. Fothergill. [illegible]: [illegible]. A. Hill Griffith. Aural Surgeon: [illegible] ntal Surgeon: Mr. W. A. Hooton. [illegible]: Dr. F. E. Tylecote. Resident Surgical Officer: Mr. H. H. Rayner. Pathological Registrar: Dr. W. B. Anderton. Medical Registrar: Dr. R. Lakin. Surgical Registrar: Dr. Howard Buck. Director of the Clinical Laboratory: Dr. G. E. Loveday. Assistant Director of the Clinical Laboratory: Dr. A. Ramsbottom. Administrators of Anæsthetics: Dr. A. F. Thompson, Dr. S. R. Wilson, Mr. Edward Moir, and Dr. E. Falkner Hill. Assistant Medical Officer: Dr. A. Ramsbottom. Assistant Surgical Officers: Mr. C. Roberts, Mr. P. R. Wrigley, and Mr. W. H. Hey. Medical Officer for Home Patients: Dr. George Ashton. Medical Officer for Radiography and Electricity Department: Mr. A. E. Barclay. General Superintendent and Secretary: Mr. Walter G. Carnt.

MANCHESTER *CHILDREN'S HOSPITAL*, *Pendlebury* and Gartside-street, Manchester.—The hospital contains 168 beds and 26 in the Convalescent Home, St. Anne's-on-Sea. The medical staff visit the hospital daily at 10 A.M. Clinical instruction is given by the medical staff at the Hospital and Dispensary. Out-patients are seen daily at 9 A.M. at the new Out-patient Department, Gartside-street, Manchester. Physicians: Dr. Hutton, Dr. Heywood, and Dr. Lapage. Surgeons: Mr. J. Howson Ray, Mr. E. D. Telford, and Mr. C. Roberts. Honorary Consulting Surgeon: Mr. G. A. Wright. Honorary Consulting Pathologist: Professor R. Lorrain Smith. Honorary Surgeon for Throat, Nose, and Ear Diseases: Mr. F. H. Westmacott. Pathologist: Dr. W. Mair. Honorary Dental Surgeon: Mr. Barron J. Rodway. Resident Medical Officers: Mr. Hugh Ashby and Mr. Neilson Wallace. Medical Officers at the Dispensary: Dr. A. H. Norris and Mr. Raymond Bury. During 1908 there were 2248 in-patients and 30,441 new out-patients were under treatment at the Dispensary, and there were 100,910 attendances made by out-patients. Secretary: Mr. H. J. Eason.

THE MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park-place, Cheetham-hill-road, Manchester.—The hospital contains 70 beds. Out-patients are seen daily from 8.30 to 10 A.M. Honorary Consulting Physicians: Dr. W. N. Maccall and Dr. T. C. Railton. Honorary Consulting Surgeons: Mr. Frederick A. Southam. Honorary Physicians for Women: Dr. Samuel Buckley and Dr. T. Arthur Helme. Honorary Surgeon for Women: Mr. Arnold W. W. Lea. Honorary Physician: Dr. J. J. Cox. Honorary Physicians for Children: Dr. C. H. Melland and Dr. C. C. Heywood. Honorary Assistant Surgeon for Women: Mr. Harold Clifford. Honorary Surgeon for Children: Mr. Philip Roscoe Wrigley. Anæsthetists: Mr. G. A. Barrow and Dr. H. R. Clarke. [illegible] ant Medical Pathologist: Dr. J. [illegible] Officers: Dr. A. W. [illegible]. Honorary Dentist: Mr. W. A [illegible] Mr. Daniel Dougal.

UNIVERSITY OF LEEDS.

Candidates presenting themselves for Matriculation in the Faculty of Medicine must pass an examination in English (Language or Literature) and English History, Mathematics and Latin, and in two of eight optional subjects. Exemption from the matriculation examination is granted to graduates of any university of the United Kingdom provided Latin has formed part of one of the degree examinations.

Four degrees in Medicine and Surgery are conferred—viz.: Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), also Degrees and Diplomas in Dental Surgery and a Diploma in Public Health.

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates for the degrees of Bachelor of Medicine and of Surgery are required to present certificates showing that they will have attained the age of 21 years on the day of graduation, and that they have attended courses of instruction approved by the University extending over not less than *five years,* two of such years, at least, having been passed in the University subsequently to the date of passing the First Examination. Candidates must also satisfy the examiners in the several subjects of the following examinations entitled respectively: the Matriculation Examination, or such other examination as may have been recognised by the Joint Matriculation Board in its stead; the First Examination; the Second Examination; and the Final Examination.

The First Examination.—The First Examination consists of: Part I., Physics and Chemistry; Part II., Biology. Candidates will be allowed to pass the two parts separately.

The Second Examination.—The Second Examination consists of: Part I., Anatomy and Physiology; Part II., Materia Medica and Pharmacy. Candidates will be allowed to pass the two parts separately.

The Final Examination.—The Final Examination consists of; Part I., Pathology and Bacteriology, Forensic Medicine, and Public Health. Part II., Medicine: Systematic and Clinical, including Mental Diseases and Diseases of Children; Surgery: Systematic, Clinical and Practical; Obstetrics and Gynæcology: Systematic, Clinical, and Practical; Pharmacology and Therapeutics. Candidates will be allowed to pass the two parts separately and they may present themselves for examination in Part I. at the end of the tenth term.

Degree of Doctor of Medicine.—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation and, if the dissertation be accepted, to pass an examination. The dissertation, of which the subject must previously have received the approval of the Board of the Faculty of Medicine, must embody the results of personal observations or original research, either in some department of medicine or of some science directly related to medicine; provided always that original work published in scientific journals or in the Proceedings of learned societies, or separately, shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree. Candidates will be required to write a short extempore essay on some topic connected with medicine and to answer questions on the history of medicine. They will also be examined orally on the dissertation or other work submitted. Any candidate may be exempted from a part or the whole of the examination if the Board of the Faculty so decide. No candidate will be admitted to the degree unless his application, after report from the Board of the Faculty of Medicine, shall have been accepted by the Senate.

Degree of Master of Surgery.—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Every candidate is also required to furnish certificates of attendance in accordance with the regulations of the University. The subjects of examination are as follows: Surgical Anatomy, Surgery, Operative Surgery, Clinical Surgery, Ophthalmology, Pathology, and Bacteriology.

Diploma in Public Health.—The regulations for this diploma will be found on p. 667.

Professors—Physics: W. Bragg, M.A., F.R.S. Chemistry: A. Smithells, B.Sc., F.R.S. Organic Chemistry: J. B Cohen, B.Sc. Zoology: W. Garstang, M.A. Botany: V. F. Blackman, M.A. Anatomy: T. Wardrop Griffith, M.D. Physiology and Histology: De Burgh Birch, M.D. Pathology: A. S. Grünbaum, M.D. Medicine: A. G. Barrs, M.D. Surgery: H. Littlewood, M.Sc., F.R.C.S. Obstetrics: J. B. Hellier, M.D. Public Health: J. S. Cameron, M.D. Therapeutics: H. J. Campbell, M.D. Forensic Medicine: F. W. Eurich, M D.

At the University of Leeds (School of Medicine) there are two Scholarships and six Prizes. The [illegible] value £73 2s. 6d., is awarded on th[illegible] Matriculation Board Examination held in July after a complete course of lectures and practical classes at the Leeds School. The Infirmary Scholarship, value £42, is awarded on the results of the First M.B. Examination of the University of Leeds after a complete course of hospital practice and clinical lectures at Leeds Infirmary. The Hardwick Prize of £10 is awarded after competitive examination in Clinical Medicine among Clinical Clerk Students of two years' standing. The McGill Prize of £10 is awarded after competitive examination among advanced surgical students in Clinical Surgery. Thorp Prizes of £10 and £5 respectively are awarded after examinations in Forensic Medicine and Hygiene, and the Thorp Prize Essay, value £15, is awarded every three years to former students of the Leeds School for an Essay or Research on some subject connected with Forensic Medicine, Toxicology, or Public Health. The Scattergood Prize of £5 is awarded after examination in Midwifery.

Clinical Instruction.—THE LEEDS GENERAL INFIRMARY, in connexion with this medical faculty, has accommodation for 524 in-patients, including 96 beds at "semi-convalescent" homes in the country. During the last year 7137 in-patients and 48,635 out-patients were treated. Clinical teaching takes place daily in the wards, and Clinical lectures are given in Medicine and Surgery by the Physicians and Surgeons. *There are Medical, Surgical, Ophthalmic,* Aural, Electro-therapeutic, [illegible] Departments, in each of which [illegible] parted to students. A Gynæco[illegible] Department, in which there were 501 confinements, together with Laryngeal and Skin Clinics, are in operation. Several valuable prizes are given at the end of each session. The following appointments at the Infirmary are annually open to students (for some of them, however, a registered legal qualification is required): Non-resident: clinical pathologist, £200; senior anæsthetist, £50; 5 anæsthetists, £25. Resident: medical officer, £150; surgical officer, £150; casualty officer, £125; ophthalmic, £100; ophthalmic house surgeon, £50. These appointments are made annually and holders are eligible for re-election. Resident medical officer to the Ida Hospital, for six months; honorarium £30. Obstetric officer, for six months; six house physicians, for six months; 7 house surgeons, for six and 12 months; 24 physicians' clerks, for six months; 24 surgeons' dressers, for six months; 16 ophthalmic and aural surgeons' dressers, for three months; 12 gynæcological ward clerks, for three months; 16 gynæcological out-patient clerks, for three months; 24 maternity clerks, for one month; 24 assistant physicians' clerks, for three months; 8 dermatological clerks, for three months; 8 laryngological clerks, for three months; 24 assistant surgeons' dressers, for three months; 8 assistant ophthalmic surgeons' dressers, for three months; 24 dressers in the casualty-room, for three months; 24 post-mortem room clerks, for three months; 8 laboratory assistants, for three months. There are appointments open to students in other medical institutions in the town and also in the West Riding (Lunatic) Asylum.

The Public Dispensary, the Hospital for Women and Children, the Fever Hospital, the Maternity Home, and the West Riding Lunatic Asylum are other medical institutions which are made use of by the Leeds students. The buildings of the Medical School are placed close to the Infirmary and contain complete accommodation for the training of medical students upon the most approved modern methods. A very fine dissecting-room, extensive laboratories for Physiology and Pathology, with the most recent improvements in fittings and apparatus, ample lecture-room accommodation, a large Library, and separate Museums for Pathology and Anatomy are some of the most striking features of the buildings. Provision for the convenience of students, in the shape of a common room, a refectory, &c., are made. The classes in Systematic and Practical Chemistry, Physics, Botany, and Zoology are held in the Science and Arts Department of the University, in College-road. Two Entrance Scholarships are offered: one, of the value of £73 2s. 6d., covering admission to all requisite lectures; and the other, of the value of 40 guineas, covering the cost of admission to the medical and surgical practice of the infirmary.

Staff of Leeds General Infirmary.—Consulting *Physicians:*

Sir Thomas Clifford Allbutt, Dr. John Edwin Eddison, and Dr. Charles M. Chadwick. Consulting Surgeons: Mr. Thomas [illegible], and Mr. Edward Ward. [illegible] John Albert Nunneley. [illegible] r. James Braithwaite. [illegible] S. Carter. Physicians: [illegible] orge Barrs, and Dr. T. W[illegible] r. Harry Littlewood, Mr. R. [illegible] Moynihan, and Mr. Walter [illegible] and Ear Department: Mr. [illegible] Whitehead. *Obstetric Physician*: Dr. J. B. Hellier. Physician with Charge of Out-patients: Dr. E. F. Trevelyan. Assistant Physician: Dr. W. H. Maxwell Telling. Assistant Surgeons: Mr. J. Faulkner Dobson and Mr. H. Collinson. Assistant Surgeon to the Eye and Ear Department: Mr. G. Constable Hayes. Pathologist: Dr. Albert S. Grunbaum. Assistant Surgeon in Charge of the Ida and Robert Arthington Semi-Convalescent Hospitals: Mr. L. R. Braithwaite. Dental Surgeon: Mr. J. B. Hordern. Medical Officer in Charge of the Electro-Therapeutic Department: Dr. L. A. Rowden. Clinical Pathologist: Dr. O. C. Gruner. Medical Registrar: Dr. George W. Watson. Surgical Registrar: Mr. J. A. Coupland. Anæsthetists: Dr. Douglas Seaton, Mr. J. Nicholson, Dr. T. P. Rowling, Dr. G. E. St. Clair Stockwell, Dr. G. Huntley Legge, and Dr. Frank Dobson.

UNIVERSITY OF SHEFFIELD.

Candidates for a medical degree shall have matriculated in the [illegible] be [illegible] sanctioned by the Joint Matriculation Board. The subjects required by the General Medical Council must be included in the Matriculation Examination or its recognised substitute.

The Degrees in the Faculty of Medicine are Bachelor [illegible] B.), Doctor [illegible] I.).

[illegible] *Surgery.*—A candidate for the degrees of M.B., Ch.B., shall produce certificates that he will have attained the age of 21 years on the day of graduation; that he has pursued the courses of study required by the University regulations during a period of not less than five years subsequently to the date of his registration as a medical student by the General Medical Council, three of such years at least having been passed in the University and one year at least having been passed in the University subsequently to the date of passing the First Examination.

The First Examination.—The subjects of examination are chemistry, physics, and biology. The examination is divided into two parts, A (chemistry and physics) and B (biology), and candidates may pass in each part separately. The Intermediate B.Sc. Examination in these subjects will, on payment of the required additional fee, be accepted instead of this examination. Candidates must, after matriculation and registration as a medical student, have attended courses of instruction (lectures and laboratory work) in chemistry, physics, and biology, for one year each.

A Special Exam[illegible] held at the end of t[illegible] after completion of [illegible]

The Second Examination.—The subjects of examination are anatomy, physiology, materia medica, and pharmacy. The examination is divided into two parts, A (anatomy and physiology) and B (materia medica and pharmacy), and candidates may pass in either part separately. Candidates must have completed the third winter session of professional study, must have passed the first examination, and must have attended (1) lectures on anatomy and dissections during two winter sessions and one summer session; (2) lectures on physiology during [illegible] practical physiology [illegible] during one summer [illegible] pharmacy for three months.

The Third or Final Examination.—The subjects of [illegible] surgery, obstetrics, and gynæcology). Candidates may present themselves for examination in both parts on the same occasion or separately, but Part A may not be passed before the completion of the fourth year of study. Candidates for the whole examination or for Part B must have completed the fifth year of study.

Degree of Doctor of Medicine.—Candidates for the degree [illegible] e examination for [illegible] r previously; must [illegible] in some subject approved by the professor of medicine, and must pass an examination in the Principles and Practice of Medicine.

Degree of Master of Surgery.—Candidates for the degree of Ch.M. must have passed the examination for the degrees of *M.B., Ch.B. at least* one year previously and must, since taking the degrees of M.B., Ch.B., have held for not less than six months a surgical appointment in a public hospital *or other* public institution, affording full opportunity for the study of Practical Surgery.

The subjects of examination are Systematic, Clinical, and Operative Surgery, Surgical Anatomy, Surgical Pathology, and Bacteriology.

Professors—Physics: W. M. Hicks, Sc.D., F.R.S. Chemistry: W. Palmer Wynne, D.Sc., F.R.S. Biology: Alfred Denny, M.Sc., F.L.S. Anatomy: C. J. Patten, M.A., M.D., D.Sc. Physiology: J. S. Macdonald, B.A., L.R.C.S., L.R.C.P. Medicine: D. Burgess, M.A., M.B., F.R.C.P. Materia Medica, &c.: W. T. Cocking, M.D. Surgery: R. J. Pye-Smith, Ch.M., F.R.C.S. Pathology: J. M. Beattie, M.A., M.D. Midwifery: R. Favell, Ch.M., M.R.C.S. Public Health: Ralph P. Williams, M.D., B.S., D.P.H.

At this University there are 12 scholarships and a Town Trust Fellowship. The Entrance Scholarship, value £116, is awarded after examination, but the candidate must read for a *Degree in Medicine*. There are three Special (1909) Scholarships, one of them for women only. All three are awarded on the results of the Joint Board Matriculation Examination and the candidates must read for a Degree in Medicine of the University of Sheffield. That for women is of the value of £100, and those for men are of the values of 150 guineas and 50 guineas respectively. There are five Town Trust scholarships, obtainable by a special examination. Two are for boys, one is for girls, and two are for boys or girls. The candidates must have been educated *in* Sheffield. *The two latter are of* the value of £60 per annum and the three former are of £50 each per annum. The Kaye Scholarship in Anatomy and Physiology, of £22 10*s*. for one year, is awarded after special examination of students who have completed the second Winter Session. [illegible] The Mechanics' I[illegible] one year (renewa[illegible] ship. The Frede[illegible] Scholarship of £50 per annum for two years is available [illegible] residing within 40 miles. [illegible] tion for these two latter. [illegible] Fellowship, value £75 per annum for one year, open to graduates of the University. Full particulars as to curriculum, scholarships, &c., may be had on application to the Registrar or to the Dean of the Medical Faculty.

Public Health.—The regulations with regard to the degrees in Sanitary Science will be found on p. 667.

The Medical School.—The new buildings of the University opened in 1905 are situated at the west end of the city, adjoining Wes[illegible] the entire nort[illegible] various athleti[illegible] management o[illegible] annually. There are large and comfortable common rooms both for men and women students. A refectory is open daily at the University where students may obtain refreshments, lunch, dinner, &c., at extremely moderate prices. The University journal *Floreamus*, edited by a committee of staff and students, is published each term. The University Hostel, Ashgate-road, is recognised by the Senate as a residence for women students, full particulars of which may be obtained of the Lady Tutor. Other societies of interest to [illegible] Chemical, and Clinical [illegible] ity is within easy reach [illegible] h it is connected for [illegible] ows: The Royal Infirmary, containing 255 beds, with an annual average number of over 3800 in-patients, over 8000 out-patients, and over 21,000 c[illegible] with 172 beds, and an annual [illegible] over 9000 out-patients, and ove[illegible] e Jessop Hospital for Disease[illegible] nearly 500 in-patients, and over 2000 out-patients; also a Maternity department, with over 250 in-patients per annum and over 700 out-patient cases attended. Special courses on Fevers are held at the City Fever Hospitals (547 beds) and on Mental Diseases at the South Yorkshire Asylum (1610 beds). For purposes of clinical practice the practices of the Royal Infirmary and Royal Hospital are amalgamated, giving a total of 427 beds for the treatment of medical, surgical, and special cases. There are special departments for the treatment of Diseases of the Eye at such institution, with wards assigned to them. *In addition to these the Royal Infirmary has special departments* for the treatment of Diseases of the Skin and Ear, with beds assigned to them, whilst at the Royal Hospital there are special out-patient departments for Diseases of the Throat, Ear, Skin, Orthopædics, and Mental Diseases. During the last year over 6000 patients passed through the wards of the two institutions, while those attending as out-patients numbered over 47,000. The medical and surgical staffs attend daily and give clinical instruction in the wards and out-patient rooms at stated times. Clinical lectures in Medicine and Surgery are given weekly at stated times. Instruction in the practical administration of anæsthetics is given at either institution by the Anæsthetists. The laboratories and lecture rooms connected with the subjects of the first and second examinations—namely, chemistry, physics, biology, anatomy, and physiology—which are in the University buildings are, both as regards structural arrangements and scientific equipment, on the most modern and complete lines. No expense has been spared in the matter of apparatus for teaching or research work and the facilities for practical study in these subjects are second to none. The department of Pathology and Bacteriology in the University is replete with every requirement for the most advanced work in these subjects. There is a large Pathological Museum in the department open daily to students. The post-mortem rooms of the Royal Infirmary and Royal Hospital are under the charge of the Professor of Pathology and afford ample material for demonstrations. In connexion with the University there is a *complete dental department, fully* recognised by the various examining bodies, at the Sheffield Royal Hospital. A list of the various Scholarships and Fellowships will be found in another column.

Students who have passed their examination in anatomy and physiology can hold the usual dresserships and clerkships, the appointments being for a period of three months except in the case of casualty dresserships, which last two months. All students beginning hospital practice in Sheffield will be required to hold the post of casualty dresser before being eligible for any other of the above appointments. In addition to the laboratories above mentioned the Medical department of the University contains lecture rooms for the various subjects of the curriculum, a complete materia medica museum, and the large library and reading-room of the Medico-Chirurgical Society which is open daily to students for purposes of study.

Fees.—Composition fee of £80, payable in three instalments—viz., £24 at commencement of first year of study, £28 at commencement of *second year of* study, and £28 at commencement of third *year of* study. A composition fee of £80 entitles the student to attendance on all the courses of lectures and practical classes except pharmacy, vaccination, and instruction in anæsthetics required for a degree course in the University or for the ordinary qualifications in medicine and surgery of the Examining Boards. The composition fee does not include medical and surgical hospital practice, clinical lectures, practical instruction in mental diseases, diseases of women, and infectious diseases, the fee for the full period of both medical and surgical hospital practice required by the Examining Boards being £42 if paid in one sum at commencement of hospital practice; or £43 1*s*. if paid in two sums of 21 guineas and 20 guineas, one on beginning hospital practice, the other twelve months later.

Staff of the Royal Infirmary, Sheffield.—Physicians: Dr. W. Dyson, B.A., Dr. W. S. Porter, and Dr. W. Tusting Cocking. Surgeons: Mr. Sinclair White, Mr. Arthur *Connell, and Mr. Archibald Cuff. Medical Officer to the* Skin Department: Dr. W. Tusting Cocking. Pathologist: Professor J. M. Beattie. Medical Officer to the Ear and Throat Department: Mr. W. S. Kerr. Ophthalmic Surgeon: Mr. G. H. Pooley. Medical Officer in Charge of Electrical Department: Dr. A. Rupert Hallam. Anæsthetists: Mr. H. T. Wightman, Mr. J. Wilfred Stokes, and Dr. A. Rupert Hallam. Honorary Secretary to the Medical Staff: Mr. Arthur Connell.

Staff of the Sheffield Royal Hospital.—Physicians: Dr. Duncan Burgess and Dr. Arthur Hall. Surgeons: Mr. H. Lockwood and Mr. Graham Simpson. Ophthalmic Surgeon: Dr. S. Riseley. Aural Surgeon: Dr. George Wilkinson. Physician for Mental Diseases: Mr. G. E. Mould. Assistant Surgeons: Mr. A. Garrick Wilson and Mr. F. A. Hadley. Assistant Physicians for Out-patients: Dr. A. E. Naish and Dr. Herbert Henry. Anæsthetists: Mr. H. Hallam, Mr. N. Milner, and Dr. C. G. Murray. Medical Officer to the Electrical and X Ray Department: Dr. W. H. Nutt. Pathologist: Professor J. M. Beattie. Honorary Secretary to the Medical and Surgical Staff: Dr. S. Riseley. Dental Surgeons: Mr. F. G. Mordaunt, Mr. F. Harrison, Mr. D. Dathl Davies, Mr. H. J. Morris, and Mr. C. C. Drabble. Assistant Dental Surgeons: Mr. P. Southwell Stokes, Mr. W. J. Law, and Mr. H. J. Stoner.

There are other institutions at which the students of the University of Sheffield can receive clinical instruction. These are the City Fever Hospitals (Medical Superintendent, Dr. Egerton H. Williams), the South Yorkshire Asylum (Medical Superintendent, Dr. W. S. Kay), and the Jessop Hospital for Women, Gell-street, Sheffield. The hospital contains 54 beds for gynæcological cases and 18 for obstetric cases. A staff of midwives connected with the hospital attend lying-in women at their own homes, and, in case of need, are assisted by the members of the medical staff. A 12 weeks' course of instruction (theoretical and practical) is also provided for resident pupil midwives, the institution being approved by the Central Midwives Board as a training centre. Medical Officers: Mr. Richard Favell, Dr. J. W. Martin, and Mr. Percival E. Barber. Assistant Medical Officer: Mr. M. H. Phillips. Honorary Secretary to the Staff: Mr. Percival E. Barber.

UNIVERSITY OF BRISTOL.

FACULTY OF MEDICINE.—The University of Bristol is the most recent of the English Universities, having been incorporated by Royal Charter during the present year to replace University College, Bristol. The regulations for the medical curriculum are still under consideration by the Senate, but we understand that they will be published before the opening of the winter session.

Courses of Lectures.—Medicine: Professor F. H. Edgeworth and Professor J. Michell Clarke. Surgery: Professor C. A. Morton and Professor James Swain. Anatomy: Professor Edward Fawcett. Practical Anatomy: Demonstrators, Mr. E. W. Hey Groves, Mr. W. S. Vernon Stock, Mr. C. B. Goulden, and Mr. W. H. A. Elliott. Physiology and Histology: Professor A. F. Stanley Kent. Demonstrator: (vacant). Chemistry: Professor Francis Francis. Public Health: Dr. D. S. Davies. Midwifery: Professor W. C. Swayne. Medical Jurisprudence: Dr. R. Eager and Dr. G. Parker. Pathology and Morbid Anatomy: Professor I. Walker Hall. Demonstrator: Dr. Emrys-Roberts. Operative Surgery: Mr. J. Paul Bush. *Practical* Medicine: Professor Edgeworth and Professor Michell Clarke. Practical Surgery: Dr. R. G. Poole Lansdown. Practical Midwifery: Mr. D. C. Rayner. Materia Medica and Practical Pharmacy: Mr. O. C. M. Davis. Pharmacology and T[illegible] Dr. Newman Neild. Biology: Professor S. H. [illegible] Chemistry: Professor Francis Francis. Practical Bacteriology: Professor I. Walker Hall. Comparative Anatomy: Professor C. Lloyd Morgan. Dental Anatomy and Physiology and Dental Histology: Mr. E. A. G. Dowling. Demonstrator: Mr. F. W. Perry, L.D.S. Dental Bacteriology: Professor I. Walker Hall. Dental Surgery and Practical Dental Surgery: Mr. W. R. Ackland. Dental Mechanics and Dental [illegible] tical Dental Metallurgy: Dr. C. A. [illegible] fee for lectures and hospital practice, 133 guineas. Composition fee for Dental lectures and surgical practice, 75 guineas; for two years' instruction in Mechanical Dentistry, 75 guineas; if whole curriculum be taken the composition fee is 140 guineas. Special six *months' course for Diploma* in Public Health. 1. Lectures on Public Health: Dr. D. S. Davies. 2. Bacteriology: Professor I. Walker Hall. 3. Laboratory Course of Hygienic Chemistry: Mr. F. W. Stoddart. 4. Demonstrations on the Various Acts, Orders, By-laws, &c.: Mr. J. C. Heaven. 5. Practical Outdoor Sanitary Work: Dr. D. S. Davies. Fee for the entire course 25 guineas. Full information can *be obtained* on application to the Dean, Professor Edward Fawcett, University College, Bristol.

Professors—Chemistry: F. Francis, D.Sc. Experimental Physics: A. P. Chattock. Zoology: S. H. Reynolds, M.A. Psychology: C. Lloyd Morgan, LL.D., F.R.S. Medicine: F. H. Edgeworth, M.D., and J. Michell Clarke, M.D. Surgery: C. A. Morton, F.R.C.S., and J. Swain, F.R.C.S. Anatomy: E. Fawcett, M.D. Physiology and Histology: A. F. Stanley Kent, M.A. Midwifery: W. C. Swayne, M.D. Pathology: I. Walker Hall.

Scholarships and Prizes.—At the University College, Bristol, there are a scholarship, three prizes, and a gold and a silver medal. The Medical Entrance Scholarship of £75 is awarded after competitive examination in subjects of general education. The Tibbits Surgical Prize of £9 9*s.* is awarded for proficiency in Practical Surgery. The Martyn Memorial Pathological Prizes of £10 each, of which there are two annually, are awarded after competitive examination in Pathology and Morbid Anatomy. A gold medal and a silver medal are given by the committees of the two institutions to the most distinguished students of the fifth year. These prizes and medals can be competed for by perpetual students of the Faculty of Medicine, University College, Bristol.

At the Bristol Royal Infirmary there are five prizes, which are restricted to perpetual students who have done the necessary qualifying work at the Infirmary. They are the Suple Medical Prize and the Suple Surgical Prize, each consisting of a gold medal of the value of 5 guineas and 7 guineas in money. The one is awarded after competitive examination in Medicine of students of the fourth and fifth years and the other after competitive examination in Surgery of students of the third and fourth years. The Henry Clark Prize, value 11 guineas, is awarded for the class work of third-year students. The Crosby Leonard Prize, value 7 guineas, is awarded after examination in Clinical Surgery, and the Augustin Prichard Prize, value 6 guineas, is awarded after examination in Surgical Anatomy.

At the Bristol General Hospital there are two scholarships and a prize, which are restricted to perpetual students who have done the necessary qualifying work at the Hospital. The Sanders Scholarship, value £22 10*s*, is awarded after competitive examination in Medicine, Surgery, and Midwifery of fourth-year students. The Clarke Scholarship of £15 is awarded after competitive examination in surgery among students of the fourth year. The Marshall Prize, value £12, is awarded to the best surgical dresser of the fourth year.

Clinical Instruction.—Students of the Faculty of Medicine are admitted to the Clinical Practice of the Bristol Royal Infirmary and the Bristol General Hospital conjointly, and consequently both these institutions are open to all students, men and women alike. The Infirmary and the Hospital comprise between them a total of 470 beds; and both have very extensive out-patient departments, special departments for the Diseases of Women and Children, and of the Eye, Ear, and Throat, besides large outdoor Maternity Departments and Dental Departments. Students may also attend the practice of the Bristol Royal Hospital for Sick Children and Women, containing 104 beds, and that of the Bristol Eye Hospital, with 40 beds. The total number of beds available for clinical instruction is 614. Very exceptional facilities are thus offered to students for obtaining a wide and thorough acquaintance with all branches of Medical and Surgical work. Each student has the opportunity of personally studying a large number of cases and of acquiring practical skill in diagnosis and treatment.

THE ROYAL INFIRMARY, BRISTOL, has 270 beds, the number of in-patients is 3869, and the number of out-patients 49,998 annually. There are separate wards for diseases of children, eye cases, diseases of women, and diseases of throat and nose. The Pathological and Bacteriological Departments are under the direction of the pathologist. In clinical pathology a special room is set apart for the exclusive use of students and research workers, and post-graduate courses may be taken over by arrangement with the pathologist. In the Pharmaceutical Department special classes are held by the pharmacist. *Clinical appointments.* All students must undergo before holding Clinical appointments preliminary instruction for three months in pathological, medical, surgical, and dental methods of diagnosis, &c. Pathological Clerkship for three months. Surgical Dresser for six months: the dressers reside in the Infirmary free of expense in rotation a week at a time, taking a part in the whole daily routine of surgical work. Medical Clerk for six months; Obstetric Clerk for three months; Ophthalmic Clerk for three months. In other special departments attendance is made during the fifth year of study. A convenient students' room is provided. Resident appointments: The posts of House Surgeon, House Physician, Obstetric and Ophthalmic House Surgeon, Throat, Nose, and Ear House Surgeon, second House Surgeon, and Casualty Officer are all salaried. The senior post is usually held for two or more years, other posts held for 12 months, and the Casualty Officer's post tenable for six months. Honorary and Consulting Physicians: Dr. W. H. Spencer, Dr. R. Shingleton Smith, Dr. H. Waldo, and Dr. J. E. Shaw. Honorary and Consulting Surgeons: Mr. E. C. Board, Mr. W. H. Harsant, Mr. A. W. Prichard, and Mr. Munro Smith. Honorary and Consulting Ophthalmic Surgeon: Mr. F. Richardson Cross. Honorary Physicians: Dr. A. B. Prowse and Dr. F. H. Edgeworth. Honorary Surgeons: Mr. J. Paul Bush, Mr. H. F. Mole, Dr. J. Swain, and Mr. T. Carwardine. Honorary Ophthalmic Surgeon: Dr. Ogilvy. Honorary Obstetric Physician: Dr. Walter Swayne. Honorary Dental Surgeon: Mr. W. R. Ackland. Honorary Physician to the Throat and Nose Department: Dr. P. Watson Williams. Honorary Assistant Dental Surgeon: Dr. Charles A. Hayman. Honorary Assistant Physicians: Dr. J. R. Charles and Dr. J. A. Nixon. Honorary Assistant Surgeons: Mr. C. F. Walters and Mr. E. H. E. Stack. Pathologist: Dr. I. Walker Hall. Honorary Demonstrator of Morbid Anatomy: Dr. J. J. S. Lucas. Honorary Anæsthetist: Mr. A. L. Fleming. Honorary Assistant Anæsthetist: Mr. S. V. Stock. Honorary Skiagraphist: Mr. James Taylor. House Surgeon and Senior Resident Medical Officer: Mr. Hubert Chitty.

BRISTOL GENERAL HOSPITAL.—Number of beds 200; number of in-patients over 2000; number of out-patients about 40,000 annually. The arrangements are practically similar to those at the Royal Infirmary. Honorary and Consulting Physician: Dr. A. J. Harrison. Honorary and Consulting Physician to Throat and Nose Department: Dr. Barclay J. Baron. Honorary and Consulting Surgeons: Mr. Robert W. Coe, Dr. George F. Atchley, Mr. Nelson C. Dobson, Mr. F. Poole Lansdown, and Mr. Chas. F. Pickering. Physicians: Dr. J. Michell Clarke, Dr. George Parker, and Dr. J. O. Symes. Surgeons: Mr. C. A. Morton, Dr. R. G. Poole Lansdown, Dr. J. Lacy Firth, and Dr. H. Greville Kyle. Physician Accoucheur: Dr. W. H. C. Newnham. Physician to Department for Diseases of the Skin: Dr. W. Kenneth Wills. Surgeon to the Throat and Nose: Dr. J. Lacy Firth. Ophthalmic Surgeon: Mr. Cyril H. Walker. Assistant Physicians: Dr. Newman Neild and Dr. Carey F. Coombs. Assistant Surgeon: Mr. E. W. H. Groves. Assistant Physician Accoucheur: Mr. D. C. Rayner. Anæsthetists: Dr. J. Freeman and Dr. Hedley Hill. Dental Surgeon: Mr. E. A. G. Dowling. Pathologist: Dr. Emrys-Roberts. Curator of Museum: Dr. W. J. H. Pinniger. Skiagraphist: Mr. J. Ellington Jones.

Resident Appointments.—There are five resident appointments in the Hospital, and the Dressers reside in rotation, free of expense. The Maternity students also have rooms provided in the institutions.

Fees.—Medical Practice: three months, 4 guineas; six months, 7 guineas; one year, 12 guineas; perpetual, 20 guineas. Surgical Practice: three months, 4 guineas; six months, 7 guineas; one year, 12 guineas; perpetual, 20 guineas. Medical and Surgical Practice together in one payment: six months, 12 guineas; one year, 20 guineas; perpetual, 35 guineas. Dental Surgical Practice: one year, 7 guineas; perpetual, 12 guineas. The above fees include Clinical Lectures. Clinical Clerkship: 5 guineas for six months. Dressership: 5 guineas for six months. Museum fee: [illegible] entrance), or 1 guinea annually. [illegible] Students from other schools or [illegible] hing to attend Clinical Practice for short periods and not requiring certificates for such attendance may do so for the following fees:—Medical and Surgical Practice conjointly: one month, 2 guineas; two months, 3 guineas; three months, 4 guineas; and six months, 7 guineas.

Further information may be obtained on application to the Dean of the Faculty.

UNIVERSITY OF WALES.

This University has now the privilege of [illegible] in Medicine and Diplomas in Public Health. At the three constituent Colleges of Aberystwyth, Bangor, and Cardiff, there are Professors of Chemistry, Botany, Zoology, and Physics, so that the students of the University can obtain proper instruction in the ancillary subjects. The foundation of a Medical Faculty has been laid at University College, Cardiff, where there is a recognised school of medicine.

University College, Cardiff: School of Medicine.—All classes are open to both men and women students who may spend three out of their five years of medical study at Cardiff. The courses of study are recognised as qualifying for the Preliminary Scientific and Intermediate Examination in Medicine in the University of London and for the corresponding examinations in the other Universities. Students who are preparing for these examinations may compound for their courses by paying a fee of £57 10*s*., while a composition fee of £41 10*s*. includes all the necessary courses for the first and second examinations for the Diploma of the Conjoint Board. In all cases the composition fees may be paid by instalments. Hospital instruction is given at the Cardiff Infirmary. The attention of students about to matriculate is drawn to the numerous entrance scholarships and exhibitions, varying in value from £10 to £30 per annum, offered for competition at University College, Cardiff, in September next, most of which may be held by medical students. Full particulars of the examination for these may be obtained by application to the Registrar. In the department of Public Health established in 1899 instruction is given qualifying for the D.P.H. examinations. Further information may be obtained from the Dean of the Faculty of Medicine.

Lecturers.—Physics: Professor A. L. Selby. Chemistry: Professor C. M. Thompson. Zoology: Professor W. N. Parker. Botany: Professor A. H. Trow. Anatomy: Professor David Hepburn. Physiology: Professor J. B. Haycraft. Materia Medica and Therapeutics: Dr. W. Mitchell Stevens. Bacteriology: Mr. H. A. Schölberg. Hygienic Chemistry: Mr. Sugden. Public Health and Hygiene: Dr. E. Walford and Dr. W. Williams. Midwifery (for Midwives): Dr. E. J. Maclean.

Clinical Instruction.—Students can attend the practice of the Cardiff Infirmary, which contains 190 beds.

Cardiff Infirmary.—Founded 1837. 194 beds. Consulting Physicians: Dr. W. T. Edwards, Dr. W. Taylor, and Dr. C. T. Vachell. Consulting Surgeon: Dr. T. Wallace. Consulting Ophthalmic Surgeon: Mr. J. T. Thompson. Consulting Dental Surgeon: Mr. John C. Oliver. Physicians: Dr. H. R. Vachell and Dr A. E. Taylor. Surgeons: Mr. P. Rhys Griffiths, Mr. William Sheen, and Mr. J. Lynn Thomas. Assistant Physicians: Dr. W. Mitchell Stevens, Dr. Cyril Lewis, and Dr. Alfred Howell. Assistant Surgeons: Mr. H. G. Cook, Mr. Cornelius A. Griffiths, and Mr. William Martin. Ear, Throat, and Nose Surgeon: Dr. D. R. Paterson. Ophthalmic Surgeons: Mr. H. C. Ensor and Mr. F P. S. Cresswell. Gynæcologists: Dr. Ewen J. Maclean and Dr. E. Tenison [illegible] Dr. H. A. Schölberg. Sanitary Advis[illegible] Anæsthetists: Dr. Fredk. W. S. Davies, Dr. W. G. Williams, and Dr. Alex. Brownlee. Dental Surgeons: Mr. W. Kittow and Mr. Thomas Quinlan. Medical Officer: Dr. Owen L. Rhys. Resident Medical Officer: Dr. John Wallace. In-patients, 2245; out-patients, 16,323.

Swansea General and Eye Hospital and Swansea Hospital Convalescent Home.—Hospital established 1817, Home 1903. Hospital 141, Convalescent Home built for 20 beds and one cot. Consulting Physicians: Dr. D. A Davies, Mr. John A. Rawlings, Dr. F. Knight, and Mr. J. S. H. Roberts. Consulting Surgeons: Mr. J. Thomas and Mr. H. A. Latimer. Physicians: Dr. E. Le C. Lancaster and Dr. D. E. Evans. Surgeons: Mr. W. F. Brook and Mr. R. O. Elsworth. Obstetric Physician: Mr. R. N. Jones. Ophthalmic Surgeon: Dr. Frank G. Thomas. Surgeon to the Throat, Nose, and Ear Department: Dr. A. F. Blagdon-Richards. Assistant Physicians: Dr. A. W. Cameron and Dr. C. L. Isaac. Assistant Surgeons: Dr. A. F. Blagdon-Richards and Mr. E. Reid. Medical Officers for Outdoor Patients: Mr. E. Reid, Dr. A. W. Cameron, and Dr. C. L. Isaac. Surgeon-Dentist: Mr. H. J. Thomas. Honorary Pathologist and Electro-Therapeutic Officer: Mr. D. R. Edwards. Anæsthetist: Dr. W. L. Griffiths. Secretary-Superintendent: W. D. Hughes. In-patients, 1751; out-[illegible] Home, 91.

ENGLISH MEDICAL CORPORATIONS GRANTING DIPLOMAS.

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

Under this heading we give the regulations for the examinations enforced by the Conjoint Examining Board of the Royal Colleges of Physicians of London and Surgeons of England and of the Society of Apothecaries upon students desiring their respective diplomas of qualification. We do not give any list of schools recognised by these bodies as eligible to prepare students for their examinations beyond mentioning that all the schools which we have already described (under the heading of the Universities to which they are attached) are recognised as suitable places of instruction by the corporations granting medical diplomas. The courses of study at the principal colonial medical schools are also recognised as qualifying for the examinations of these corporations.

Any candidate who desires to obtain both the Licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England is required to complete five years of *professional study* at recognised Medical Schools and Hospitals and to comply with the following regulations and to pass the examinations hereinafter set forth. Six months of the curriculum may be spent in an Institution recognised by the Board for instruction in Chemistry, Physics, Practical Chemistry, and Biology.

Professional Examinations.—There are three Examinations, called herein the First Examination, the Second Examination, and the Third or Final Examination, each being partly written, partly oral, and partly practical. These examinations will be held in the months of January, April, July, and October, unless otherwise appointed. Every candidate intending to present himself for examination is required to give notice in writing to Mr. F. G. Hallett, secretary of the Examining Board, Examination Hall, Victoria Embankment, W.C., 14 clear days before the day on which the examination commences, transmitting at the same time the required certificates.

The subjects of the *First Examination* are—Chemistry, Physics, Elementary Biology, and Practical Pharmacy. A candidate may take this examination in three parts at different times (Chemistry and Physics must be taken together until the required standard is reached in both or in one of these subjects, but a candidate will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other). A candidate will be admitted to examination in Chemistry and Physics, in Practical Pharmacy, and Elementary Biology on producing evidence of having passed the required Preliminary Examination and of having received instruction in these subjects at a recognised institution, but he may take Pharmacy at any time during the curriculum. Certificates must be produced of 180 hours' instruction and laboratory work in chemistry; 120 hours' instruction and laboratory work in physics; and 120 hours' instruction and laboratory work in biology. These courses need not be completed within one year, nor need they run concurrently, and they may be commenced or attended before the candidate passes the required preliminary examination in general education. Synopses of the subjects of examination may be obtained on application. A candidate rejected in one part or more of the First Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection, and he will be re-examined in the subject or subjects in which he has been rejected. If referred in Chemistry, Physics, or Biology he must produce evidence of further instruction at a recognised Institution. Any candidate who shall produce satisfactory evidence of having passed an examination for a degree in Medicine on any of the subjects of this examination conducted at a university in the United Kingdom, in India, or in a British colony will be exempt from examination in those subjects in which he has passed.

The fees for admission to the *First Examination* are as follows: For the whole examination, £10 10*s.*; for re- [illegible] Parts I. and II., £3 3*s.*; and [illegible] other parts, £2 2*s.*

[illegible] *Examination* are Anatomy and Physiology. Candidates will be required to pass in both subjects at one and the same time. Candidates will be admissible to the Second Examination on production of the required certificates of professional study. The study of Anatomy and Physiology before passing in two of first three parts of the First Professional Examination is not recognised.

A candidate referred on the *Second Examination* will be required, before being admitted to re-examination, to produce a certificate that he has pursued, to the satisfaction of his teachers, in a recognised place of study, his Anatomical and Physiological studies during a period of not less than three months subsequently to the date of his reference.

The fees for admission to the *Second Examination* are: £10 10*s.* for the whole examination and £6 6*s.* for re-examination after rejection.

The subjects of the *Third* or *Final Examination* are: Part I. Medicine, including Medical Anatomy, Pathology, Practical Pharmacy, Therapeutics, Forensic Medicine, and Public Health. Candidates who have passed in Practical Pharmacy at the First Examination will not be re-examined in that subject at the Third Examination. Part II. Surgery, including Pathology, Surgical Anatomy, and the use of Surgical Appliances. Part III. Midwifery and Diseases Peculiar to Women. Candidates may present themselves for examination in Midwifery and Diseases of Women at any time after the completion of the fourth year of professional study at a Medical School and Hospital, not less than one year after passing the Second Examination, on production of the required certificates. Candidates may present themselves for examination in Medicine and Surgery at the completion of the five years' curriculum, not less than two years from the date of passing the Second Examination, on production of the required certificates. Candidates may take this examination in three parts at different times, or they may present themselves for the whole examination at one time. They will be required to produce the following evidence before being admitted to the several parts of the *Third* or *Final Examination*—viz., in Medicine, of having attended Lectures on Medicine, Pathology including Bacteriology, Pharmacology, and Therapeutics, Forensic Medicine, and Public Health; Practical Instruction in Medicine; Medical Hospital Practice during two winter and two summer sessions; Demonstrations in the Post-mortem Room during 12 months; Clinical Lectures on Medicine during nine months; of having discharged the duties of Medical Clinical Clerk; Instruction in the Administration of Anæsthetics; Practice of a Fever Hospital and Clinical Demonstrations at a recognised Lunatic Asylum; in Surgery, of having attended Lectures on Surgery and Pathology including Bacteriology; Practical Instruction in Surgery; of having performed operations upon the Dead Subject; Surgical Hospital Practice during two winter and two summer sessions; Demonstrations in the Post-mortem Room during 12 months; Clinical Lectures on Surgery during nine months; of having discharged the duties of Surgical Dresser; Instruction in the Administration of Anæsthetics; and Clinical Instruction in Ophthalmology; in Midwifery of having attended Lectures on Midwifery; Practical Instruction in Midwifery; Clinical or other Lectures, with Practical Instruction in Diseases Peculiar to Women; and of attendance on 20 Labours.

The fees for admission to the *Third* or *Final Examination* are as follows: For the whole examination, £21. Part I. [illegible] Anatomy, [illegible] Public [illegible] Pharmacy [illegible] re-exami- [illegible] Anatomy, [illegible] II. For re- [illegible] Women, [illegible] £3 3*s.*

A candidate referred on the *Third* or *Final Examination* will not be admitted to re-examination until after the lapse of a period of not less than three months from the [illegible] before bei[illegible] Practice, or the Medical [illegible] case may be, during the period of his reference; and in regard to Midwifery and Diseases Peculiar to Women a certificate of having received, subsequently to the date of his reference, not less than three months' instruction in that subject by a recognised teacher.

Students of recognised universities in England, Scotland, and Ireland, who have passed examinations for a degree in Medicine at their universities in the subjects of the First and Second Examinations of the Examining Board, may enter for the Final Examination at the expiration of two years from the date of passing in Anatomy and Physiology, on production of the required certificates.

Graduates in Medicine of certain recognised Indian, Colonial, and Foreign universities may present themselves for the Final examination under special conditions which can be ascertained on application to the Secretary.

ROYAL COLLEGE OF PHYSICIANS OF LONDON: THE MEMBERSHIP AND FELLOWSHIP.

In addition to the diplomas granted by the English Conjoint Board, the Royal College of Physicians of London and the Royal College of Surgeons of England grant honour diplomas, which no longer give the right to practise professionally if held separately. The Royal College of Physicians of London has two such diplomas, the *Fellowship* which is a purely honorary distinction and the *Membership* which is obtained by examination.

Membership.—Every candidate for the Membership of the College must furnish proof of having attained the age of 25 years. Candidates must not be engaged in trade, dispense medicine, make any engagement with a chemist, or any other person for the supply of medicine, or practise medicine or surgery in partnership, by deed or otherwise. Any candidate being already registered or having passed a qualifying examination in accordance with the Medical Act of 1886, who has obtained the degree of Doctor or Bachelor of Medicine at a University in the United [illegible] to be unde[illegible] een adjudged by the Ce[illegible] the Censors think fit) [illegible] The nature and exten[illegible] case of each candidate, be determined by the Censors' Board. All other [illegible] of medicine and may be modified in circumstances to be ascertained by application to the Registrar. For example, candidates under 40 years of age are examined in an ancient or modern language, a test from which their seniors are exempt. The fee for admission as a Member of the College is 40 guineas, except when the candidate for Membership is a Licentiate of the College, in which case the fee already paid for the Licence shall be deducted from the 40 guineas. The fee for the examination is £6 6*s.*

Fellowship.—The *Fellows* are selected annually from the ranks of the *Members.*

ROYAL COLLEGE OF SURGEONS OF ENGLAND: THE FELLOWSHIP.

The Royal College of Surgeons of England confers its diploma of Fellow upon a few distinguished persons in an honorary capacity. Two Members of long standing may also be elected to the Fellowship annually. But the bulk of the Fellows obtain the diploma as the result of examination.

Fellowship.—The examination for the Fellowship is divided into two parts—viz., the First Examination and the Second Examination. The subjects of the First Examination are Anatomy and Physiology and the questions on these subjects may require an elementary acquaintance with Comparative Anatomy and Physiology. The examination is partly written and partly *vivâ voce.* The subjects of the Second Examination are Surgery, including

Surgical Anatomy and Pathology. The examination is partly written and partly *vivâ voce* and includes the examination of patients and the performance of operations on the dead body. The examinations are held during the months of May and November of each year.

The fees for examination are:—First Examination, each admission, five guineas. Second Examination, each admission, 12 guineas. Of such examination fees 17 guineas will be reckoned as part of the fee payable upon admission to the Fellowship. The fee to be paid upon admission to the Fellowship is 30 guineas, except when the candidate is a Member of the College, in which case the fee is 20 guineas.

A Member of the College is admissible to the First Examination at any time after receiving his Diploma of Membership. A candidate who is not a member of the College is admissible to the first Professional Examination for the Fellowship on the production of evidence of having passed the First and Second Examinations of the Examining Board in England by the Royal College of Physicians of London and the Royal College of Surgeons of England (or, if a member of a University recognised by the College for the purpose, of having passed the Examinations in his University equivalent to the First and Second Examinations of the Board) and on the production of certificates of attendance upon certain courses of study described in the Regulations.

A Member of the College is admissible to the Second Examination at any time after having passed the First Examination, on producing satisfactory evidence of having been engaged not less than six years in the study (or study and practice) of the profession.

A candidate who is not a Member of the College must possess the registrable surgical and medical degrees recognised by the Council and must have been engaged in the study (or study and practice) of the profession for not less than four years subsequent to the date of obtaining the recognised qualification, one year of which shall have been spent in attendance on the Surgical Practice of a recognised hospital. The diploma of Fellow is not conferred upon successful candidates until they have attained the age of 25 years.

The Regulations may be obtained on application to the Secretary of the Examining Board, Examination Hall, Victoria Embankment, London, W.C.

SOCIETY OF APOTHECARIES OF LONDON.

There are two examinations—Primary and Final. The Final examination is divided into Section I. and Section II. The Primary examination is held quarterly. Final examinations are held monthly. No examinations are held in the month of September.

The Primary examination consists of two parts. Part I. Elementary Biology; Chemistry, Chemical Physics, including the Elementary Mechanics of Solids and Fluids, Heat, Light, and Electricity; Practical Chemistry; and Materia Medica and Pharmacy. A synopsis indicating the range of the subjects in the examination will be sent with the regulations on application. Evidence of instruction in these subjects must be produced prior to examination. Part II. includes Anatomy, Physiology, and Histology. This examination cannot be passed before the completion of twelve months' Practical Anatomy with Demonstrations, and these subjects cannot be taken separately except in the event of the candidate having previously passed in one. Evidence must be produced of the candidate's course of study. A schedule for the Primary examination, to be obtained of the Secretary, must be signed by the Dean of the Medical School or other authority. Section I. of the Final examination consists of three parts. Part I. includes the Principles and Practice of Surgery, Surgical Pathology, and Surgical Anatomy, Operative Manipulation, Instruments, and Appliances. Part II. includes the Principles and Practice of Medicine, Pharmacology, Pathology, and Morbid Histology; Forensic Medicine, Hygiene, Theory and Practice of Vaccination; and Mental Diseases. Part III. includes Midwifery, Gynæcology, and Diseases of New-born Children and the Use of Obstetric Instruments and Appliances. Section I. of the Final examination cannot be passed before the expiration of 45 months after registration as a medical student, during which time not less than three winter sessions and two summer sessions must have been passed at one or more of the medical schools connected with a general hospital recognised by the Society. Section II. of the Final examination consists of two Parts. Part I. Clinical Surgery; Part II. Clinical Medicine and Medical Anatomy. Section II. cannot be passed before the end of the fifth year.

The course of study for the *Primary examination* is as follows:—Elementary Biology, not less than three months; Chemistry and Chemical Physics, six months; Practical Chemistry, three months; Pharmacy and Dispensing, three months; Anatomy, six months; Practical Anatomy with Demonstrations, 12 months; Physiology, six months; Histology with Demonstrations, three months. The study of these subjects must be pursued at a Medical School recognised by the Society. Instruction in Pharmacy and Dispensing must be given by a registered medical practitioner or by a member of the Pharmaceutical Society by examination or in a public hospital, infirmary, or dispensary.

The course of study for the *Final examination, Section I.*, includes attendance on the Surgical and Medical Practice (with Post-mortem Examinations) at a hospital connected with a medical school for a period of one winter and one summer session; lectures on the Principles and Practice of Surgery, six months; Practical Surgery, three months; Clinical Surgical Lectures, nine months; Dressership, six months; Performance of Surgical Operations on the Dead Body; lectures on Principles and Practice of Medicine, six months; Pathology, three months; Clinical Medical Lectures, nine months; Clinical Clerkship, six months; Forensic Medicine, Hygiene, and Insanity, three months; Midwifery and Gynæcology, three months; Clinical Instruction in the same, three months; a course of Practical Midwifery; attendance on 20 Midwifery cases. The course of medical study must extend over the above-mentioned period of 45 months and the offices of dresser or clinical clerk must be held at a hospital, or other institution recognised by the Society.

The course of study for the *Final examination, Section II.*, includes either attendance on the Practice of Medicine and Surgery at a hospital or other institution recognised by the Society for a further period of 12 months, or six months as above and six months as a pupil of a registered practitioner holding a public medical or surgical appointment, or attendance at two special hospitals for six months (three months at each hospital), and for six months at a general hospital, all such hospitals to be recognised by the Society. Evidence shall also be given of practical instruction in Infectious Diseases and in Mental Diseases (at a lunatic asylum or in the wards of an institution containing a special ward set apart for the treatment of mental diseases), and in any two of the following subjects: Ophthalmic Surgery, Laryngology with Rhinology and Otology, Dermatology, and Diseases of Children. No candidate is eligible for the Final examination who has not completed the curriculum prescribed by the Society, in evidence of which a schedule, to be obtained of the Secretary, must be produced, signed by the Dean of the Medical School or other authority. Prior to Section II. of the Final examination the candidate must produce certificates: (1) of being 21 years of age; (2) of moral character; (3) of the course of medical study; (4) of proficiency in vaccination signed by a teacher authorised by the Local Government Board; and (5) of instruction in the administration of anæsthetics. Candidates intending to present themselves for examination are required to give 14 days' notice. A form for this purpose will be sent on application.

Licentiates are eligible for the Membership of the Society of Apothecaries. Particulars may be obtained on application to the clerk.

The fee for the Licence is 20 guineas. The examination offices are open from 10 A.M. to 4 P.M.; on Saturdays from 10 A.M. to 1 P.M. All letters should be addressed to the Secretary, Court of Examiners, Society of Apothecaries of London, Blackfriars, E.C.

METROPOLITAN ANCILLARY SCHOOLS AND HOSPITALS AFFORDING FACILITIES FOR CLINICAL OBSERVATION.

THE institutions which follow provide to the medical student and medical graduate facilities for different forms of instruction and clinical observation. In each case further information can be obtained from the secretary of the hospital.

THE SEAMEN'S HOSPITAL SOCIETY possesses two hospitals —the *Dreadnought* Hospital at Greenwich, 250 beds, and the Branch Hospital in the Royal Victoria and Albert Docks, E., 50 beds. It has also two Dispensaries—one in the East India Dock-road and the other at Gravesend—from which the patients are transferred to the hospitals. The London School of Clinical Medicine is attached to the *Dreadnought* Hospital and the medical staff is as follows:—Physicians: Sir Dyce Duckworth, Bart., Dr. F. Taylor, Dr. J. Rose Bradford, Dr. Guthrie Rankin, and Dr. S. Russell Wells. Surgeons: Sir William Bennett, K.C.V.O., Mr. W. Turner, Mr. A. Carless, and Mr. L. H. McGavin. Ophthalmic Surgeon: Mr. L. V. Cargill. Surgeon for Diseases of the Skin: Sir Malcolm Morris, K.C.V.O. Surgeon for Diseases of the Throat, Nose, and Ear: Mr. Richard Lake. Physician in charge of the Electrical Department: Dr. M. D. Sale Barker. Assistant Physicians: Dr. Thomas Lewis, Dr. Carmalt Jones, and Dr. Fredk. Langmead. Assistant Surgeons: Mr. E. Rock Carling and Mr. C. C. Choyce. Assistant Physician for Diseases of the Skin: Dr. Wilfrid Fox. Assistant Ophthalmic Surgeon: Dr. R. Bickerton. Assistant Surgeon for Diseases of the Throat, Nose, and Ear: Mr. G. N. Biggs. Anæsthetists: Dr. M. Horne, Dr. C. Hughes, Dr. V. B. Orr, and Dr. R. E. Delbruck. Dean: Mr. C. C. Choyce. Medical Superintendent: Dr. M. Mackinnon. The London School of Tropical Medicine is attached to the Albert Dock Hospital of the Society and the medical staff is as follows:—Physicians: Sir Patrick Manson, K.C.M.G., and Dr. Andrew Duncan. Surgeons: Mr. J. Cantlie and Mr. C. C. Choyce. Assistant Physicians: Dr. F. M. Sandwith and Dr. C. W. Daniels. Ophthalmic Surgeon: Mr. L. V. Cargill. Dental Surgeon: Mr. K. W. Goadby. Assistant Surgeon: Mr. H. Curtis. Director: Dr. C. W. Daniels. Medical Officer East India Dock-road Dispensary: Mr. W. H. F. *Oxley*. Surgeon Gravesend Dispensary: Mr. C. E. Robbs. Secretary: Mr. P. J. Michelli, C.M.G.

WEST LONDON HOSPITAL, Hammersmith-road, W.—This hospital has 160 beds, all of which are constantly in use. About 2600 *in-patients and* 37,000 *out-patients*, whose attendances number 100,000, are treated annually. Attached to the hospital is the West London Post-Graduate College. The practice of the hospital is reserved exclusively for qualified men, no junior students being admitted. Instruction is given in the medical and surgical out-patient rooms and demonstrations are given in the wards daily. Post-graduate lectures and demonstrations are given daily except Saturdays; notice of the commencement of each course is advertised in the medical journals. Special Classes are held in Diseases of the Throat and Nose, Skin, and Eye, and in Gynæcology, Medical Electricity, Operative Surgery, [illegible] gery, Surface Ana[illegible] opy, Tropical Medi[illegible] Operative Ophthalmolog [illegible] ates consists of a [illegible] and writing rooms, [illegible] pathological laboratory at which instruction is given in elementary bacteriology, a class being held every month. The fees for hospital practice, including lectures, are £6 6*s.* for three months or £15 15*s.* for one year. The certificate of the hospital is accepted by the Admiralty, War Office, and India Office in cases of study leave. Further information can be obtained on application to the Dean, Mr. L. A. Bidwell, at the hospital. Physicians: Dr. Seymour Taylor, Dr. A. P Beddard, and Dr. E. A. Saunders. Physicians for Diseases of Women: Dr. J. A. Mansell-Moullin and Dr. Drummond Robinson. Surgeons: Mr. C. B. Keetley, Mr. F. Swinford Edwards, and Mr. L. A. Bidwell. Surgeon for Diseases of the Eye: Mr. H. P. Dunn. Assistant Surgeon for Diseases of the Eye: Mr. Bishop Harman Assistant Physicians: Dr. H. Davis, Dr. H. Pritchard, and Dr. Grainger Stewart. Assistant Surgeons: Mr. A. Baldwin, Mr. Donald Armour, and Mr. John Pardoe. Surgeon-*Dentist*: Mr. H. Lloyd Williams. Physician in charge of Throat and Nose and Aural Department: Dr. H. J. Davis. Physician in charge of Children's Department: Dr. E. A. Saunders. Surgeon in charge of Orthopædic Department: Mr. C. B. Keetley. Pathologist: Dr. Bernstein. Dermatologist: Dr. P. S. Abraham. Administrators of Anæsthetics: Messrs. T. Gunton Alderton, Rickard W. Lloyd, E. W. Lewis, and G. P. Shuter. Assistant Anæsthetists: Dr. Austin Cooper, Dr. E. F. Travers, and Dr. H. M. Page. Electrician: Mr. E. D. MacDougal. Secretary of the Hospital: Mr. R. J. Gilbert; of the Post-Graduate College: Mr. H. Grant Rawle.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway-road, N.—This hospital is recognised by the Examining Board in England of the Royal Colleges of Physicians and Surgeons as a place of study during the fifth year of the medical curriculum. Besides the Honorary Staff there are two resident House Physicians, three resident House Surgeons, five Anæsthetists, Pathologist, and Resident Medical Officer. The hospital contains 179 beds which are now fully occupied. A ward for children under five years of age has been added this year. The large rectangular and circular wards, each of which contains 24 beds, the observation wards, the two operation theatres, general and special out-patient and *pathological departments, are specially designed* with a view of offering the greatest facilities for clinical work. An electrical department is also provided. Medical practitioners are cordially invited to see the general and special practice of the hospital. Demonstrations are given daily in the wards and out-patient departments and during the coming winter session there will be a weekly clinical lecture. Clinical assistants (qualified), clinical clerks, and pathological clerks are appointed in the general and special departments and may receive certificates at the end of their terms of office. Further particulars from Mr. Arthur Edmunds, F.R.C.S., 30, Welbeck-street, W. Consulting Physicians: Sir S. Wilks, Bart., Sir R. W. Burnet, and Dr. E. C. Beale. Physicians: Dr. A. Morison, Dr. T. J. Horder, Dr. Symes Thompson, Dr. Willcox, Dr. Hinds Howell, and Dr. H. W. Wiltshire. Obstetric Physicians: Dr. G. F. Blacker and Dr. Cuthbert Lockyer. Physician for Skin: Dr. A. Whitfield. Surgeons: Mr. P. T. B. Beale, Mr. G. B. M. White, Mr. E. C. Stabb, Mr. V. W. Low, and Mr. Arthur Edmunds. Ophthalmic Surgeons: Mr. A. S. Morton and Mr. Geo. Coats. Throat and Ear Surgeons: Mr. E. B. Waggett and Mr. J. Gay French. Dental Surgeon: Mr. C. Peyton Baly.

PRINCE OF WALES'S GENERAL HOSPITAL, Tottenham, N.—This general hospital is in the midst of a densely populated neighbourhood of more than half a million inhabitants. It contains medical, surgical, gynæcological, and children's wards, having in all 125 beds. There are special departments for gynæcological cases, diseases of the eye, ear, throat, and nose, skin diseases, medical electricity and radiography, and dentistry. Operations are performed every afternoon of the week (except Saturday) at 2.30 P.M. Clinical instruction, laboratory classes, and lectures are given daily in the wards and out-patient departments, labora*tories, and lecture hall in connexion with the North-East* London Post Graduate College attached. There are four Resident Medical Officers, and Clinical Assistants are appointed under certain conditions. Further particulars in regard to the hospital may be obtained from Mr. H. W. Carson, Secretary to the Medical Committee, 26, Welbeck-street, W.; or from *Dr. A. J. Whiting, Dean of the North-*East London Post-Graduate College, 142, Harley-street, W. Consulting Physicians: Sir James Reid, Bart., and Dr. Percy Kidd. Consulting Surgeons: Mr. J. Langton, Mr. G. Lichtenberg, and Mr. Hooper May. Physicians: Dr. R. Murray Leslie, Dr. G. P. Chappel, and Dr. A. J. Whiting. Assistant Physicians: Dr. A. G. Auld *and Dr.* T. R. Whipham. Surgeons: Mr. Walter Edmunds and Mr. H. W. Carson. Assistant Surgeon: Mr. J. Howell Evans. Gynæcologist: Dr. A. E. Giles. Surgeon to Ear, Nose, and *Throat Department*: Mr. H. W. Carson. Ophthalmic Surgeon: Mr. R. P. Brooks. Physician for Skin Diseases: Dr. G. Norman Meachen. Medical Officer in charge of the X Ray and Electrical Departments: Dr. A. H. Pirie. Dental Surgeon: Mr. W. Douston. Anæsthetists: Mr. A. De Prenderville, Mr. F. Herbert Wallace, and Mr. J. F. Trewby. Pathologist: Dr. G. Macdonald. Medical Registrar: Dr. Kenneth Kellie. Surgical Registrar: Mr. E. Gillespie. *Secretary*: Mr. F. W. Drewett.

LONDON TEMPERANCE HOSPITAL, Hampstead-road, N.W. (Established 1873).—Physicians: Dr. Fenwick, Dr. Parkinson, and Dr. Addinsell. Assistant Physician: Dr. Kevin Byrne. Surgeon: Sir William J. Collins. Assistant Surgeon: Mr. H. J. Paterson. *Assistant Ophthalmic Surgeon*: Mr. J. Stroud Hosford. Dental Surgeon: Mr. A. Alexander. The hospital contains 100 beds. The in-patients in 1908 were 1312, and the out-patients and casualties numbered 28,707 new cases. The medical and surgical practice of the hospital is open to students and practitioners. Operations: Mondays and Thursdays, 3.30 P.M.

Amalgamated Hampstead General and North-West London Hospitals.—The North-West London Hospital (Kentish Town-road) and the Hampstead General Hospital have now been amalgamated. The out-patients of both hospitals attend exclusively at the North-West London Hospital, where there is a Resident Medical Officer as well as resident nurses. The Hampstead General Hospital accommodates the in-patients from the districts hitherto served by the North-West London Hospital. We append below the present staff of the Amalgamated Hospital so far as the appointments have been made. Consulting Physician: Sir Samuel Wilks, Bart. Consulting Surgeon: Mr. Edmund Owen. Physicians to In-patients: Dr. G. A. Sutherland and Sir John F. H. Broadbent, Bart. Surgeons to In-patients: Mr. J. Jackson Clarke, and Mr. W. H. Clayton-Greene. Physicians to Out-patients: Dr. C. O. Hawthorne, Dr. F. W. Price, and Dr. A. Manuel. Surgeons to Out-patients: Mr. J. W. Thomson Walker. Mr. W. Fedde Fedden, and Mr. G. E. Waugh. Physician for Diseases of the Skin: Dr. S. E. Dore. Gynæcologist: Dr. F. E. Taylor. Ophthalmic Surgeon to In-patients: Sir William J. Collins. Ophthalmic Surgeon to Out-patients: Mr. Malcolm L. Hepburn. Dental Surgeon: Mr. C. H. J. Acret. Throat and Ear: Mr H. S Barwell. Anæsthetists: Dr. G. A. H. Barton and Mr. Hedley C. Visick. Pathologist: Dr. J. A. Torrens. Medical Officer, Roentgen Ray Department: Mr. S. Gilbert Scott. Further particulars from the secretary at the hospital.

New Hospital for Women, 144, Euston-road, N.W.—Physicians for In-patients: Miss Cock, M.D., and Miss Walker, M.D. Surgeons for In-patients: Mrs. Boyd, M.D., and Miss Aldrich-Blake, M.D., M.S. Physicians and Surgeons for Out-patients: Miss Macdonald, M.B., Miss Chadburn, M.D., B.S., Miss Anderson, M.D., B.S., and Miss Woodcock, M.D., B.S. Children's Department: Mrs. Flemming, M.D. Ophthalmic Surgeon: Miss Sheppard, M.B. Assistant Physicians for Out-patients: Miss Chesney, M B., Miss Bolton, M.D., B.S., Miss Woodward, M.B., B.S., Miss Hamilton, M.D., B.S., Miss M. Paine, M.B. Assistant Obstetrician: Miss Turnbull, M.D. Anæsthetists: Miss Browne, L.S.A., Miss Turnbull, M.D., and Miss Payne, M.D. A considerable number of the students hold posts in the New Hospital under the visiting staff, and in return for much valued clinical teaching they do the work assigned to students in the wards of a general hospital. Secretary: Miss M. M. Bagster.

French Hospital and Dispensary, Shaftesbury-avenue, W.C.—This hospital, which was founded in 1867 to afford medical treatment for poor foreigners who speak the French language, has 70 beds. It has a convalescent home at Brighton with accommodation for 61 patients, including a pavilion for the preventive treatment of consumption. Physicians: Dr. G. Ogilvie and Dr. L. Williams. Physicians to the Out-patients: Dr. L. Vintras, Dr. H. Dardenne, and Dr. Alex. Mannel Surgeons: Mr. E. Owen, Mr. H. de Méric, and Mr. W. H. Clayton-Greene. Obstetric Physician: Dr. S Sunderland. Ophthalmic Surgeons: Mr. C. Higgens and Mr. G. W. Thompson. Dental Surgeon: Mr. M. Thomson. Honorary Anæsthetist: Mr. Walter Tyrrell. Anæsthetist: Dr. Percy Bott.

German Hospital, Dalston, N.E.—This hospital was founded in 1845 with the object of supplying medical aid to poor people speaking the German language and for cases of emergency and of accident. It has 130 beds, including a sanatorium with six beds and a convalescent home at Hitchin with 22 beds. Consulting Physician: Sir H. Weber. Consulting Surgeon: Mr. R. W. Parker. Physicians: Dr. F. P. Weber, Dr. K. Fürth, and Dr D. O'C. Finigan. Surgeons: Mr. E. Michels, Mr. J. P. zum Busch, and Mr. G. J. Jenkins. Ophthalmic Surgeons: Mr. R. Gruber and Mr. C. Markus. Anæsthetist: (vacant). Radiographer: Mr. N. S. Finzi. Dental Surgeon: Mr. W. West. Resident Medical Officers: Mr. A. Jurasz, Mr. C. Miéville, Mr. M. Pfister, and Mr. G. Dorner.

Italian Hospital.—This institution was established in 1884 for the maintenance and medical treatment of Italian and Italian-speaking people, irrespective of their religious and political opinions, who may be suffering from sickness or bodily infirmity, but the sick poor of any nationality are also admitted for treatment. The institution also provides surgical and medical relief to Italians and others not being inmates of the hospital. It has 50 beds. Honorary Consulting Physicians: Cav. Dr. M. Castaneda and Sir Dyce Duckworth. Honorary Consulting Surgeon: Sir Frederick Treves. Physicians: Cav. Dr. F. Naumann, Cav. Dr. F. Melandri, and Dr. Vincent Dickinson. Assistant Physician: Dr. Herbert Danvers. Surgeon: Mr. George Lenthal Cheatle, C.B. Assistant Surgeon: Mr. T. P. Legg. Throat and Ear Department: Cav. Mr. J. Donelan. Ophthalmic Surgeon: Mr. Stanford Morton. Consulting Dental Surgeon: Cav. Mr. J. FitzGerald. Assistant Dental Surgeon: Mr. E. Whishaw Wallis. Anæsthetists: Dr. Hugh Richard Phillips and Mr. Laurence Galsworthy.

National Hospital for the Paralysed and Epileptic (Albany Memorial), Queen-square, Bloomsbury.—The hospital, with the Finchley branch, contains 200 beds and cots. The physicians attend every Monday, Tuesday, Wednesday, and Friday at 2 P.M. In- and out-patient practice and electrical-room treatment at that hour. Consulting Physicians: Dr. Hughlings Jackson, Dr. Buzzard, Dr. Bastian, and Dr. D. Ferrier. Physicians: Sir William Gowers, Dr. Ormerod, Dr. Tooth, and Dr. James Taylor. Physicians for Out-patients: Dr. J. S. Risien Russell, Dr. Aldren Turner, Dr. Batten, and Dr. J. S. Collier. Assistant Physicians: Dr. F. Buzzard, Dr. Grainger Stewart, and Dr. Gordon Holmes. Surgeons: Sir Victor Horsley, Mr. Donald J. Armour, and Mr. Percy W. G. Sargent. Ophthalmic Surgeon: Mr. Marcus Gunn. Assistant Ophthalmic Surgeon: Mr. Leslie Paton. Laryngologist and Otologist: Mr. Sydney Scott. Gynæcologist: Dr. Walter Tate. Anæsthetist: Dr. Llewelyn Powell. Clinical clerks are appointed under the in-patient physicians. Lectures are given on Tuesdays and Fridays at 3.30. The hospital is a school of the University of London and has been recognised by the Conjoint Board for England as a place where part of the fifth year may be devoted to clinical work. All communications concerning clinical appointments, lectures, and hospital practice should be addressed to the Secretary at the hospital.

Bethlem Royal Hospital.—This hospital is open for the admission of two Resident House Physicians who have recently obtained their diplomas to practise Medicine and Surgery. They will be permitted to reside in the hospital for a term generally not exceeding six months, commencing July 1st and Jan. 1st, and will be provided with apartments, complete board, attendance, washing, and a salary at the rate of £100 per annum. They will be under the direction of the Resident Physician and will be elected by the Committee from candidates whose testimonials appear to be most satisfactory. The students of certain specified London Medical Schools receive Clinical Instruction in the wards of the hospital and qualified practitioners and other students may attend for a period of three months on payment of a fee of £3 3*s*. Lectures are also given in connexion with the London School of Clinical Medicine and the London Polyclinic. Resident Physician: Dr. T. B. Hyslop. Senior Assistant Physician: Dr. W. H. B. Stoddart. Junior Assistant Physician: Dr. J. G. Phillips.

Hospital for Consumption and Diseases of the Chest, Brompton (318 beds).—The Sanatorium at Frimley contains 110 beds and 40 beds for paying patients. Four House Physicians reside in the hospital for a period of six months. Pupils are admitted to the practice of the hospital: terms, £1 1*s*. for one month; three months, £2 2*s*.; perpetual, £5 5*s*. Lectures and Clinical Demonstrations are given throughout the year by members of the medical staff. The next course will commence in October. Courses of instruction are given in laboratories for one month (£5 5*s*.). Qualified medical men are received as clinical assistants in the out-patient department without fee. Clinical Assistants are appointed to the Assistant Physician in the out-patient department and Clinical Clerks to the Physician in the wards. The hospital has been recognised by the Conjoint Board for England as a place where six months of the fifth year may be spent in clinical work. The medical practice of the hospital is also recognised by the University of London, the Apothecaries' Society, and the Army and Navy and Indian Medical Boards. The hospital contains 318 beds in the two buildings. Consulting Physicians: Dr. J. E. Pollock, Sir Richard Douglas Powell, Dr. F. T. Roberts, Dr. C. T. Williams, Dr. J. M. Bruce, Dr. T. H. Green, Dr. J. K. Fowler, Dr. T. D. Acland, and Dr. P. Kidd. Physicians: Dr. R. Maguire, Dr.

H. W. G. Mackenzie, Dr. S. H. Habershon, Dr. F. J. Wethered, Dr. P. Horton-Smith Hartley, and Dr. J. J. Perkins. Assistant Physicians: Dr. H. Batty Shaw, Dr. W. C. Bosanquet, Dr. R. A. Young, Dr. C. Wall, Dr. W. J. Fenton, and Dr. A. J. Jex Blake. Consulting Surgeons: Lord Lister and Mr. R. J. Godlee. Surgeon: Mr. S. Boyd. Dental Surgeon: Mr. G. L. Bates. Surgeon to Throat and Ear Department: Dr. Dundas Grant. Superintendent of Laboratories: Dr. A. C. Inman; X-ray Department: Dr. A. H. Greg. Resident Medical Officer: Dr. McNalty.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.—During the past year 1158 in-patients have been treated in the wards, and the large number of 41,045 cases since the opening of the wards in 1855. QUEEN CHARLOTTE'S LYING-IN HOSPITAL AND MIDWIFERY TRAINING SCHOOL, Marylebone-road, N.W.—This hospital receives over 1800 patients annually, besides having a large out-patient department. Medical pupils are received at all times of the year. Pupils have unusual opportunities of seeing obstetric complications and operative midwifery, on account of the very large number of primiparous cases—nearly three-fourths of the total admissions. Clinical instruction is given on the more important cases which present themselves. Certificates of attendance at this hospital are recognised by all the Universities, Colleges, and licensing bodies. Pupil midwives and monthly nurses [illegible] Fees: Medical Students, [illegible] Medical Practitioners, [illegible] ives (including board [illegible] Pupil Nurses (including board and lodging), £24 for [illegible] Residential College provides accommodation for 16 men at a time, students and qualified practitioners, and is opposite the hospital, with which it is in telephonic communication. Terms for residence and full board 35*s.* per week. For further particulars application should be made to Mr. Arthur Watts, Secretary at the hospital. Students [illegible]

instruction in Practical Midwifery in accordance with the recommendations of the General Medical Council. This instruction will include: (1) Practical instruction in the methods of examination of pregnant women; (2) delivery of women in labour under the direct supervision of a Medical Officer of the hospital; (3) practical instruction in the treatment of the mother and child during the puerperium, including clinics held four times weekly by the Visiting Medical Staff; and (4) instruction in the Clinical Laboratory of the hospital. The fee for hospital practice will be £5 5*s.* per calendar month. Students will be accommodated at the Residential College adjoining the hospital. Terms for residence and full board, 35*s.* per week. Consulting Physicians: Dr. George B. Brodie and Dr. W. S. A. Griffith. Consulting Surgeon: Mr. Alfred Willett. Physicians to In-patients: Dr. W. Rivers Pollock, Dr. W. J. Gow, Dr. T. W. Eden, and Dr. A. F. Stabb. Physicians to Out-patients: Dr. C. Hubert Roberts and Dr. Thomas G. Stevens.

THE HOSPITAL FOR WOMEN, Soho-square, W.—In connexion with the out-patient department there has been *for* some years a well-organised Clinical Department. [illegible] t as clinical assistants to the [illegible] The appointments are open [illegible] d women. They are entitled to receive notice of all operations performed within the hospital, and every facility is afforded them by the gynæcologists in the out-patient department of obtaining experience in diagnosis and treatment and the practical use of instruments. Fee for one month £2 2*s.*; for each subsequent month the same. The hospital contains 60 beds. In the out-patient department there were over 4000 new cases during the past year, the total number of out-patient attendances being 14,850. This large number affords exceptional opportunities for examining and studying most of the varieties of the diseases of women. Applications should be made to the Dean. Consulting Physicians: Dr. C. H. Carter and Dr. E. Holland. Consulting Surgeon: Mr. H. A. Reeves. Consulting Surgeon Dentist: [illegible] Richard Smith, Dr. J. [illegible] Fenwick (in charge of [illegible] Dr. J. H. Dauber, and D [illegible] ecologist: Dr. H. J. F. Simson. Surgeon: Mr. D. Drew. Assistant Surgeon: Mr. L. H. McGavin. Surgeon Dentist: Mr. W. J. May. Anæsthetists: Mr. C. J. Ogle and Dr. M. Horne. Registrar, Dr. W. A. Milligan.

EAST LONDON HOSPITAL FOR CHILDREN AND DISPENSARY FOR WOMEN, Glamis-road, Shadwell, E.—The hospital maintains 120 cots, and on an average 245 out-patients are seen daily. Clinical instruction is given by the physicians and surgeons to the hospital, which is recognised by the Conjoint Board for England as a school of medical teaching for students in the fifth year of the curriculum. All particulars may be obtained on application to the Secretary. Two clinical clerkships for qualified or unqualified students are open every three months, subject to reappointment if desired. Clinical assistants (qualified men only) are from time to time appointed in the out-patient department. Any additional information may be obtained on applying to Mr. W. M. Wilcox, the Secretary, at the hospital. Physicians: Dr. Eustace Smith, Dr. J. A. Coutts, Dr. Morley Fletcher, Dr. E. Graham Little, and Dr. A. M. Gossage. Surgeons: Mr. W. Trotter and Mr. W. H. Bowen. Assistant Physicians: Dr. Clive Riviere, Dr. O. K. Williamson, and Dr. T. Fisher. Assistant Surgeon: Mr. R. Warren. Ophthalmic Surgeon: Mr. W. I. Hancock. Dental Surgeon: Mr. E. S. Pierrepont. Medical Officer for the Electrical Department: Dr. H. Manders. Medical Officer for the Casualty Department: Dr. J. Scott Burne. Resident Medical Officer: Dr. H. B. Carlyle. House Physician: Mr. C. McNeill. House Surgeon: Mr. F. J. Wheeler. Secretary: Mr. W. M. Wilcox.

The Hospital for Sick Children, Great Ormond-street, W.C., contains 222 beds, divided into 95 medical, 105 surgical, and 22 for special and infectious cases, besides 38 beds at the convalescent branch, Highgate. The hospital having been recognised by the Conjoint Board for England as a place where, under the new curriculum, six months of the fifth year may be spent in clinical work, the practice is arranged to meet this need and is open to students who have completed four years of medical study and also to qualified medical men. The medical staff are recognised by the University of London as teachers in Diseases of Children. Appointments are made every three months to six medical clerkships, which are open to students of the hospital. Lectures or demonstrations are given once every week during both winter and summer sessions, which qualified practitioners are invited to attend free of charge. There is a museum in connexion with the hospital. The sessions are of ten weeks' duration, and begin in October, January, and March. Fees for hospital practice, three months, 5 guineas; perpetual ticket, 10 guineas. Clinical Clerks, 1 guinea for three months. Consulting Physicians: Dr. W. H. Dickinson, Dr. W. B. Cheadle, Sir Thomas Barlow, Bart., Dr. D. B. Lees, and Dr. F. G. Penrose. Physicians: Dr. A. E. Garrod, Dr. A. F. Voelcker, Dr. W. S. Colman, and Dr. F. E. Batten. Physicians to Out-patients: Dr. G. F. Still, Dr. F. J. Poynton, Dr. Robert Hutchison, Dr. H. Thursfield, and Dr. T. Thompson. Consulting Surgeons: Sir Thomas Smith, Bart., Mr. Howard Marsh, Mr. Edmund Owen, Mr. John H. Morgan, C.V.O., and Mr. Bernard Pitts. Surgeons: Mr. W. Arbuthnot Lane, Mr. Thomas H. Kellock, Mr. H. Stansfield Collier, and Mr. Edred M. Corner. Surgeons to Out-patients: Mr. G. E. Waugh, Mr. H. A. T. Fairbank, and Mr. O. L. Addison. Ophthalmic Surgeon: Mr. J. Herbert Parsons. Aural Surgeon: Mr. G. E. Waugh. Dental Surgeon: Mr. W. Warwick James. Radiographer: Dr. Ironside Bruce. Local Medical Officer for Cromwell House: Dr. A. M. Henderson. Medical Registrar: Dr. Miller. Clinical Pathologist and Bacteriologist: Dr. Graham Forbes. Anæsthetists: Mr. Graham Scott, Mr. E. E. Argles, and Dr. H. S Sington, Resident Medical Superintendent: Mr. H. T. Gray. Secretary: Mr. Stewart Johnston.

Evelina Hospital for Sick Children, Southwark-bridge-road, S.E.—This hospital contains 76 cots and a very extensive Out-patient Department. About ten clinical assistants, to work with the Honorary Medical Staff for Out-patients, are appointed quarterly for a period of three months; there is no salary attached to these posts; but, on the other hand, no fees are charged. Consulting Physicians: Dr. J. F. Goodhart, Dr. Frederick Taylor, and Dr. Nestor Tirard. Physicians: Dr. J. Charlton Briscoe, Dr. T. R. Whipham, and Dr. D. Forsyth. Physicians in charge of Out-patients: Dr. H. C. Mann and Dr. Otto May. Physician in charge of Skin Department: Dr. S. Ernest Dore. Consulting Surgeons: Sir H. G. Howse, Mr. R. Clement Lucas, Mr. G. H. Makins, Mr. F. S. Eve, Mr. F. C. Abbott, Mr. A. H. Tubby, and Mr. C H. Fagge. Surgeons: Mr. H. S. Clogg and Mr. W. M. Mollison. Surgeons in charge of Out-Patients: Mr. C. A. R. Nitch and Mr. P. Maynard Heath. Dental Surgeon: Mr. Denison Pedley. Ophthalmic Surgeon: Mr. Sydney Stephenson. Aural Surgeon: Mr. G. N. Biggs. House Physician: Mr. H. E. Bloxsome. Anæsthetist: Mr. F. D. S. Jackson. Radiographer: Mr. R. H. Cooper. Secretary: H. C. Staniland Smith.

Victoria Hospital for Children, Chelsea, S.W.—The hospital contains 104 beds and has a large out-patient department (over 1200 weekly); the home at Broadstairs has 50 beds. Consulting Physicians: Sir Francis Laking, Sir Wm. Henry Allchin, and Dr. Ridge Jones. Consulting Surgeons: Mr. Cowell, Mr. Pickering Pick, and Mr. D'Arcy Power. Physicians: Dr. Walter Carr, Dr. Humphry D. Rolleston, Dr. Edmund Ivens Spriggs, Dr. Charles Miller, Dr. Reginald Jewesbury, and Dr. Alexander Manuel. Physician to Skin Department: Dr. J. M. H. MacLeod. Surgeons: Mr. H. F. Waterhouse, Mr. Joseph Cunning, and Mr. Fedde Fedden. Surgeons to the Out-patients: Mr. S. Maynard Smith, Mr. Ralph Thompson, and Mr. Harold W. Wilson. Ophthalmic Surgeon: Mr. C. Devereux Marshall. *Dental Surgeon: Mr. Francis R. Smyth. Anæsthetists: Dr.* Randolph Grosvenor, Dr. W. B. Grandage and Dr. C. G. H. Gunning. Electro-Therapeutic and Radiographic Department: Mr. E. S. Worrall. Resident Medical Officer: Mr. A. C. D. Firth. House Surgeon: Mr. J. Alan Simmons. House Physician: Mr. H. F. L. Hugo. Secretary: Mr. H. G. Evered. Out-patients are seen as under:—Diseases of the Eye: Wednesday, 2 P.M. Diseases of the Skin: Wednesday, 2 P.M. Whooping-cough Cases: Fridays, 9.30 A.M. Medical and Surgical Cases: Monday and Thursday mornings at 9 A.M.; any afternoon except Wednesday and Saturday at 12.30 P.M. Dental Cases: Wednesday mornings at 9.30 A.M. Accidents and urgent cases are admitted at any time.

The Queen's Hospital for Children (*late North Eastern Hospital for Children*), Hackney-road, Bethnal Green, E. (Telephone 305 Dalston. Telegrams: "Neh," London). For the sick children of the poor under 12 years of age. Established 1867. 130 beds.—During the past year 1734 in-patients and 30,746 out-patients (representing 74,121 attendances and including 12,834 casualty cases) were relieved, 749 of the in-patients being under two years of age. Consulting Physicians: Dr. W. Cayley, Dr. W. Pasteur, Dr. W. A. Wills, and Dr. James Taylor. Consulting Surgeons: Sir Jonathan Hutchinson, Mr. Waren Tay, Mr. R. J. Godlee, Mr. Bilton Pollard, and Mr. H. Percy Dean. Phy*sicians: Dr. J. Porter Parkinson, Dr. George Carpenter,* and Dr. Charles Bolton. Assistant Physicians: Dr. Sheffield Neave, Dr. R. A. Chisolm, Dr. Eric Pritchard, and Dr. Eric Bellingham-Smith. Surgeons: Mr. Douglas Drew and Mr. Ewen C. Stabb. Assistant Surgeons: Mr. P. Lockhart Mummery and Mr. J. M. G. Swainson. Ophthalmic Surgeon: Mr. Sydney Stephenson (Thursday, 2.30 P.M.). Physician in charge of Skin Department: Dr. J. L. Bunch. Dental Surgeon: Mr. S. F. Rose (Tuesday, 9.30 A.M., and Friday, 2.30 P.M.). Medical Radiographer: Dr. William Hampson. Pathologist and Bacteriologist: Mr. W. Anstruther Milligan. Resident Medical Officer: Dr. E. Bellingham-Smith. Assistant Resident Medical Officer: Dr. J. A. Jamieson. Three other resident medical men (appointed half-yearly)—viz., House Physician and two House Surgeons. Matron: Miss Bushby. Secretary: Mr. T. Glenton-Kerr. The surgeons attend on Wednesdays at 2 P.M. and Fridays and Saturdays at 9.30 A.M.; the physicians daily at 2 P.M., except Saturday, 9.30 A.M., and Wednesday, 9.30 A.M., as well as 2 P.M. *Applications for permission to attend* the practice of the hospital should be addressed to the secretary.

Royal London Ophthalmic Hospital (Moorfields, 1804–1899), City-road, E.C. 138 beds.—This hospital, known as Moorfields Eye Hospital, was moved in 1899 to larger buildings in City-road. In 1908 there were 2331 in-patients, the new out-patients were 46,744, and the attendances were 120,366. Operations are performed daily from 10 A.M. to 1 P.M. and four surgeons attend on each day. Students are admitted to the practice of the hospital. Fee for six months, £3 3*s.*; perpetual, £5 5*s.* Courses of instruction on the following subjects are given at the hospital periodically: (1) examination of the eye; (2) the use of the ophthalmoscope; (3) errors of refraction; (4) external diseases of the eye; (5) surgical anatomy of the eye; (6) motor anomalies; (7) pathology of the eye; (8) practical pathology; (9) bacteriology; (10) operative surgery; (11) X ray work; and (12) clinical lectures. A composition fee of £10 10*s.* will entitle students of the hospital to a perpetual ticket and will admit them once to all the above lectures and demonstrations except the classes on practical pathology, bacteriology, operative surgery, and X ray work. Students of the hospital are eligible for the offices of house surgeon or clinical and junior assistants. Junior assistants are appointed every three months. Any further information will be furnished by Mr. Robert J. Bland, Secretary. Consulting Physician: Sir Stephen Mackenzie. Consulting Surgeons: Sir Jonathan Hutchinson, Mr. J. Couper, Mr. E. Nettleship, Sir John Tweedy, Mr. W. Tay, and Mr. A. S. Morton. Physician: Dr. J. Taylor. Surgeons: Mr. R. M. Gunn, Mr. W. Lang, Mr. J. B. Lawford, Mr. E. T. Collins, Mr. W. T. H. Spicer, Mr. P. Flemming, Mr. J. H. Fisher, Mr. A. Lawson; and Mr. C. D. Marshall. Assistant Surgeons: Mr. J. H. Parsons, Mr. C. Worth, and Mr. W. I. Hancock. Medical Officer to the X Ray Department: Mr. J. M. Davidson. Curator and Librarian: Mr. G. Coats. Bacteriologist: Dr. B. H. Wedd. Senior *House Surgeon: Mr. N. E. Gibbs.* Second House Surgeon: Mr. W. Ward. Third House Surgeon: Mr. H C. Snell Refraction Assistants: Mr. T. Phillips, Mrs. Warner, and Mr. G. T. Mould.

Royal Westminster Ophthalmic Hospital, King William-street, West Strand.—The hospital *contains 40 free* beds. Patients, who number over 12,000 annually, are seen at 1 P.M., and operations performed daily at 2 P.M. The following are the days of attendance of the surgeons: Mr. Grimsdale and Mr. Brewerton, Mondays and Thursdays; Mr. Roll *and Mr. McMullen, Tuesdays and Fridays*; and Mr. Dodd and Mr. Cruise, Wednesdays and Saturdays. The *practice of the hospital is open* to practitioners and students. Fees for six months, £3 3*s.*; *perpetual*, £5 5*s.* Students of the hospital are eligible for the posts of house surgeon, assistant house surgeon, pathologist, and clinical assistants. Special demonstrations and lectures will be given during the session, commencing early in *October; for* details see weekly journals. Clinical Assistants (who must be duly qualified) to the Surgical Staff are appointed for periods of six months. Secretary: Mr. John Hy. Johnson.

Royal Eye Hospital, St. George's-circus, Southwark, S.E.—There *are 40 beds* and *2 cots. There* were 68,890 attendances in the Out-patient Department last year and the new patients numbered 21,923. Operations *are performed*, and out-patients are seen daily at 9 A.M. and 2 P.M. The following are the days of attendance:—Afternoons: Professor M. M. McHardy, Tuesdays and Thursdays; Sir William J. Collins, Mondays and Wednesdays; Mr. L. V. Cargill, Tuesdays and Fridays; and Mr. J. Strond Hosford, Mondays and Saturdays. Mornings: Mr. E. Brooksbank James, Mondays and Thursdays; Dr. H. Willoughby Lyle, Tuesdays and *Fridays. Qualified* practitioners *and students* are admitted to the practice of the hospital upon the recommendation of the medical staff. Courses of instruction in Ophthalmology will be given, commencing October, January, and May. In addition, special lectures and clinical *demonstrations* will be given by the hospital staff on dates to be announced. Fee for the course, including three months' hospital practice, £3 3*s.* Tutorial classes for the various examinations arranged as far as possible *to suit candidates Clinical* assistantships are open to fully qualified practitioners who have received a course of instruction at the hospital. Further particulars may be obtained from the honorary secretary, Dr. H. Willoughby Lyle.

Central London Ophthalmic Hospital, Gray's Inn-road, W.C.—This hospital has 26 beds and possesses facilities for clinical teaching daily. Last year there were 408 in- and 12,104 out-patients (entailing 28,002 attendances). Classes of instruction in the various branches of Ophthalmology will be held during the winter session, commencing in October. The out-patient work begins at 1 o'clock and operations are performed *daily between* 1 and 4. Consulting Physician: Sir Dyce Duckworth, Bart. Surgeons: Mr. T. Brittin Archer, Mr. Ernest Clarke, and Mr. A. P. L. Wells. Assistant Surgeons: Mr. Stephen Mayou and Mr. Malcolm Hepburn. Physician: Mr. Charles O. Hawthorne. Pathologist: Mr Stephen Mayou. House Surgeon: Mr. Wm. Hackney. Dentist: Mr. E. P. May. Secretary: Mr. H. R. S. Druce.

Central London Throat and Ear Hospital, Gray's Inn-road.—In addition to the new In-patient Department and operation theatre the hospital has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past year 9993 out-patients (involving 46,859 attendances) and 564 in-patients were treated. The fee for three months' attendance, 5 guineas; for six months, 8 guineas. The post graduate teaching consists of successive series of practical demonstrations by the members of the staff delivered twice weekly during the winter and summer sessions. They are so arranged that practitioners joining at any part of the course are enabled to complete the *group of subjects. A special Operative* Surgery class is held at intervals. The fee for each course is 2 guineas, with daily attendance at the out-patient department during the period of the course. Details of subjects, &c., will be afforded by the Dean. Considerable attention is given to scientific work, particularly with regard *to* Bacteriology of the ear and respiratory passages. Operation days: in-patients, Tuesday, Wednesday, Thursday, and Friday, at 2 P.M.; out-patients, daily at 9 A.M. Consulting Physician: Dr. Arthur Orwin. Surgeons: Dr. Dundas Grant, Dr. Percy Jakins, Mr. Chichele Nourse, Dr. Abercrombie, Mr. Stuart Low, and Dr. Andrew Wylie. Assistant Surgeons: Dr. Atkinson, Dr. McKenzie, and *Mr. Gay French. Pathologist:* Dr. Wyatt Wingrave. Dental Surgeon: *Mr.* Whishaw Wallis. Assistant Dental Surgeon: Mr. Henning James. Anæsthetists: Mr. W. Hotten George and Dr. Beresford Kingsford. Assistant Anæsthetists: Dr. Mortimer and Dr. Crampton. In addition the following appointments are open to qualified members of the profession:—Six Registrars, tenable for twelve months; and sixteen Clinical Assistants, tenable for three or six months. Dean: Dr. Wyatt Wingrave. Secretary: Mr. Richard Kershaw.

London Throat Hospital, 204, Great *Portland-street*, W.—Clinical Demonstrations on the Diseases of the Throat, Nose, and Ear are given daily at 2 P.M. and on Tuesday and Friday evenings at 6 P.M. Operations are performed daily at 9.30 A.M. Individual instruction is given in the examination of cases to students attending the hospital. Fees: one month's attendance, £1 1*s.*; three months, £2 2*s.*; perpetual, £5 5*s.* Detailed information may be obtained from *the Hon. Secretary of the Medical Committee. Surgeons:* Mr. Claud Woakes, *Dr. G. Cathcart, Dr. W. H.* Kelson, and Mr. Atwood Thorne. Assistant Surgeons: Mr. Sommerville Hastings and Dr. Irwin Moore.

The Metropolitan Ear, Nose, and Throat Hospital.—*The hospital was founded in* 1838 *and is situated in Grafton-street, Tottenham-court-road.* The out-patient department is opened daily at 2.30 P.M. to all medical practitioners and senior students for acquiring clinical instruction and technical knowledge. Operations upon in-patients are performed on Tuesdays, Wednesdays, Thursdays, and Fridays at 9.30 A.M. Fee for one month's attendance at the hospital £1 1*s.*, and for three months £2 2*s.* During the forthcoming session practical demonstrations will be given by members of the st[illegible] [illegible] treatment of diseases of the ear and [illegible] course may commence at any t[illegible] [illegible]: Mr. G. Saunders and Mr. J. Pickett. Surgeons: Mr. H. Pegler, Mr. F. Spicer, Mr. W. J. Horne, and Mr. J. C. Potter. Assistant Surgeons: Mr. C. Fox, Mr. B Jones, Mr. A L. Murison, and Mr. E. W. *Bain. Anæsthetists: Mr. C. Looseley and Mr. D. J. Munro. Dentist: Mr. J. A. Bowes.*

Royal Ear Hospital, Dean-street, Soho. (Founded 1816.)—Courses of instruction of a practical character in Diseases of the Ear and Nose are given by the members of the staff throughout the year. Clinical assistants are also *appointed. Students may* join at any time. For information address the Honorary Secretary of the Medical Board, Royal Ear Hospital, Dean-street, Soho. Surgeons: Mr. M. Yearsley and Mr. Richard Lake. Assistant Surgeons: Mr. W. H. Bowen, Mr. R. S. Cocke, Mr. E. A. Peters, and Mr. A. Evans. Anæsthetists: Mr. J. H. Chaldecott and Dr. Harold Sington. Ophthalmic Surgeon: Mr. H. W. Lyle. Dental Surgeon: Mr. F. W. Barrett.

St. Peter's Hospital for Stone and Urinary Diseases, Henrietta-street, Covent Garden. Established 1860. New Hospital opened, 1882.—Honorary Surgeons: Mr. F. Swinford Edwards and Mr. P. J. Freyer. Assistant Surgeons: Mr. John Pardoe, Mr. J. W. Thomson Walker, and Mr. J. Swift Jolly. The hospital contains 30 beds for men and 2 beds for women and children. Consultations are held and operations are performed each Wednesday and Friday at 2 P.M. *Medical practitioners* and students are invited to *the clinical instructions* which are given in the wards and out-patient department daily, and to the operations in the theatre on Wednesdays and Fridays at 2 P.M. Average beds occupied daily, 29; average out-patients seen daily, 125.

St. John's Hospital for Diseases of the Skin Leicester-square, W.C. Rebuilt 1905.—The in-patient department, 40 beds, is at 262, Uxbridge-road, W. The out-patient practice is open to the medical profession at the following times: Every day, from 2 to 4 P.M., and every evening (except Saturday) 6 to 8. At the afternoon clinics specially selected Clinical Demonstrations, also demonstrations on the different diseases presenting themselves in the out-patient department, will be given. The X ray department is in operation every afternoon except Saturday. The Chesterfield Lectures are given on Thursdays at 6 P.M. October to March in the lecture room at 49, Leicester square. The opening lecture on "The Danger to the Community of the Beauty Specialists—So Called" will be given by Dr Morgan Dockrell on Oct. 7th. At the end of the course the Chesterfield silver medal may be competed for by those who have attended three-fourths of the lectures.

Physicians: Dr. Morgan Dockrell, Dr. M. K. Hargreaves, Dr. Thomas D. Savill, and Dr. Alfred Eddowes. Surgeon: Mr. G. W. Dawson. Assistant Physicians: Dr. Agnes F. Savill, Dr. V. H. Rutherford, Dr. Louis F. Knuthsen, and Dr. William Griffith. Medical Officer to X-ray Department: Mr. Chisholm Williams. There is a well-equipped laboratory where special courses in Pathology and Bacteriology of the Skin may be arranged for.

London Lock Hospital and Rescue Home.—This institution consists of a hospital for females in the Harrow-road and a hospital for males in Dean-street, Soho. At the latter branch an out-patient department is attached and both sexes receive treatment. In the female branch there are 138 beds and 379 patients were admitted in 1908. In the male branch there are 27 beds which during 1908 accommodated 243 patients. 25,213 out-patients were treated. Patients are seen at Dean-street on Mondays from 1 to 2 P.M. and from 6 to 8 P.M.; on Tuesdays and Wednesdays from 6 to 8 P.M.; on Fridays from 2 to 3 P.M. (female patients); and on Saturdays from 2 to 4 P.M. Consulting Surgeons: Mr. Buxton Shillitoe and Mr. J. A. Bloxam. Consulting Ophthalmic Surgeon: Mr. Henry Edward Juler. Physician: Dr. Sidney Phillips. Surgeons: Mr. J. Ernest Lane, Mr. Arthur Shillitoe, and Mr. Charles Gibbs. Surgeons to Out-patients: Mr. Charles Gibbs, Mr. Arthur Shillitoe, Mr. Charles Ryall, Mr. Herbert J. Paterson, and Mr. Ernest C. Hughes. House Surgeon at the Female Hospital: Mr. J. Johnston Abraham. House Surgeon at the Male Hospital and Out-patients' Department: Mr. Basil Wallis.

Cooke's School of Anatomy, Physiology, and Operative Surgery, London.—The school is prepared to admit to its supplementary work all who may wish to join the same, but in regard to its curriculum work it does not receive more than half-a-dozen students in the course of the year; these have special advantages both as regards Anatomy and Physiology. Charges are but slightly in excess of current charges and particulars are forwarded on application. By the decision of various examining bodies gentlemen rejected at their Anatomical and Physiological Examinations can get signed up for the supplementary work they are required to put in before re-examination. The operations of surgery are performed on the dead body and the courses are recognised for army promotion. The school possesses a good collection of physiological and chemical apparatus, and candidates for the higher examinations receive special instruction in the more difficult subjects.

ENGLISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS.

Under this heading we include all the hospitals which are recognised by the English Royal Colleges for a part of the required attendance on medical and surgical practice, for medical clerkships, and surgical dresserships. The list includes nearly every hospital of a general character in the country having more than 150 beds, though occasionally a large hospital is omitted because equally good opportunities are afforded to students at other institutions in its neighbourhood, while a small hospital may be included because no such facilities for study are present elsewhere. The list is arranged alphabetically as to the town where the hospital is located.

Bath Royal United Hospital, Bath.—This hospital contains 130 beds. Consulting Physician: Dr. A. E. W. Fox. Consulting Surgeons: Mr. R. J. H. Scott and Mr. F. K. Green. Physicians: Dr. G. A. Bannatyne, Dr. T. W. Smith, and Dr E. J. Cave. Honorary Medical Officers: Dr. G. E. Bowker, Dr. L. H. Walsh, and Dr. R. Waterhouse. Surgeons: Mr. T. D. Ransford, Mr. H. G. Terry, and Mr. F. Lace Assistant Surgeons: Mr. W. S. Melsome, Mr. E. L. Fuller, and Mr. F. Fraser. Physician to Electrical Department: Dr. P. King. Pathologist and Curator of Museum: Dr. R. Waterhouse. Anæsthetist: Mr. J. R. Benson. Assistant Anæsthetist: Dr. W. G. Mumford. Dental Surgeon: Mr. W. J. Royal. Assistant Dental Surgeon: Mr. S. Carter. Secretary: Mr. J. M. Sheppard. House Physicians: Dr. A. J. Bruce-Leckie and Dr. T. McPherson.

Bedford County Hospital, Bedford.—This hospital has 100 beds. Consulting Physician: Dr. G. P. Goldsmith. Consulting Surgeons: Mr. E. C. Sharpin and Mr. R. H. Kinsey. Physicians: Dr. R. Coombs and Dr. W. Phillips. Surgeons: Mr. W. Gifford Nash and Mr. Henry Skelding. Ophthalmic Surgeon: Dr. H. Goldsmith. Assistant Physicians: Dr. A. C. Perram and Dr. G. T. Birks. Assistant Surgeons: Dr. S. J. Ross and Mr. Walter Sharpin. Dental Surgeon: Mr. F. W. Williams. Secretary: Mr. W. F. Morley.

Bradford Royal Infirmary, Bradford.—This hospital contains 220 beds. Consulting Physicians: Dr. Reginald G. Alexander, Dr. Herbert C. Major, and Dr. David Goyder. Physicians: Dr. Henry J. Campbell, Mr. Thomas Wilmot, Dr. Richard Honeyburne, and Dr. F. W. Eurich. Consulting Surgeons: Mr. John N. Terry, Mr. Philip E. Miall, and Mr. Harry Meade. Surgeons: Mr. William H. Horrocks, Mr. Charles F. M. Althorp, Dr. Thomas J. Wood, and Mr. John B. Hall Gynæcologist: Dr. A. C. F. Rabagliati. Laryngologist: Dr. Adolph Bronner. Assistant Surgeons: Mr. James Phillips and Mr. Francis W. Goyder. Assistant Physicians: Dr. John B. Dunlop and Dr. William Wrangham. Electrical Department: Mr. William Mitchell. Dental Surgeon: Mr. Arthur A. Matthews.

Sussex County Hospital, Brighton (196 beds).—This hospital affords ample facilities for students, possessing a large out-patient department, a library, and a well-appointed clinical research and bacteriological department. The hospital does not take resident pupils, but out-pupils may attend the practice of the hospital for any period not exceeding two years on payment in advance of such a fee, not exceeding [illegible] Committee of Management shall direct. [illegible] Dr. Rutter, Dr. Hollis, and Dr. Branfoc [illegible] F. G. Dill, Dr. Hobhouse, and Dr. Maynard. Assistant Physicians: Dr. W. Broadbent, Dr. Hall, and Dr. Bailey. Consulting Surgeons: Mr. H. P. Blaker and Mr. W. Furner. Surgeons: Mr. T. J. Verrall, Mr. R. F. Jowers, and Mr. F. J. Paley. Assistant Surgeons: Mr. A. Buck, Mr. T. H. Ionides, and Mr. W. A. Bowring.

Kent and Canterbury General Hospital, Canterbury.—The hospital contains 104 beds. Pupils of the staff are admitted to the practice of the hospital and have the use of the library of the East Kent and Canterbury Medical Society for £7 7s. Operation day, Thursday, 11 A.M. Physicians: Dr. Harold Wacher and Dr. M. T. Williams. Consulting Surgeons: Mr. James Reid and Mr. Frank Wacher. Surgeons: Dr. T. Whitehead Reid, Mr. J. Greasley, Mr. Sidney Wacher, and Mr. Z. Prentice. Dentist: Mr. R. S. N. Faro. Secretary: Mr. Arthur J. Lancaster.

Derbyshire Royal Infirmary, Derby.—This hospital contains 229 beds. Consulting Physicians: Dr. Charles A. Greaves and Dr. Winfred Benthall. Physicians: Dr. Edmund Vaudrey, Dr. Maurice Parry-Jones, and Dr. Frank B. Thornton. Consulting Surgeons: Mr. John A. Sharp, Dr. William G. Curgenven, Mr. Charles H. Hough, and Mr. John L. Wright. Surgeons: Dr. Richard H. Luce, Mr. John A. Southern, Mr. Francis L. A. Greaves, and Mr. John E. Kilvert. Ophthalmic Surgeon: Mr. Edwin Collier Green. Gynæcologist: Mr. Henry T. Hicks. Anæsthetist: Mr. W. St. A. St. John. Pathologist: Dr. Hugh Barber. Dental Surgeons: Mr. Charles J. Allin and Mr. J. Montague Murphy.

Royal Devon and Exeter Hospital, Exeter.—Medical and Surgical Staff: Consulting Physician: Dr. Drake. Physicians: Dr. H. Davy and Dr. William Gordon. Surgeons: Mr. J. D. Harris, Mr. E. J. Domville, Mr. Charles E. Bell, and Mr. A. C. Roper. Medical Registrar and Pathologist: Mr. Reginald V. Solly. Surgeon Dentist: Mr. J. M. Ackland. Anæsthetists: Mr. Henry Andrew and Mr. J. Shirley Steele-Perkins. The hospital contains 200 beds (including special children's wards) and has a good library, museum, dissecting room, and post-mortem room. Attendance on the practice of this hospital qualifies for all the examining boards. Arrangements can be made by which students can attend Midwifery on application to the House Surgeon. There is also a Private Nursing Staff attached to the hospital. For particulars as to fees, &c., apply to the Matron. A new wing was added in 1897. Arrangements may be made by which gentlemen in practice desiring to increase their qualifications may have the use of the museum and library and other facilities and by which students may attend midwifery. A new Operating Theatre was opened in 1906 (the gift of Mrs. Nosworthy, of Newlands, Dawlish, Devon). An Electrical Treatment Department (the gift of Mrs. M. A. Sanders) was opened in 1907 by Lady Duckworth-King.

WEST OF ENGLAND EYE INFIRMARY, Exeter.—Physician: Dr. William Gordon. Surgical Staff: Mr. A. C. Roper and Mr. Ransom Pickard. Assistant Surgeon: Mr. G. P. Hawker. Secretary: Mr. Sidney E. Whitton. The infirmary contains 64 beds. Students of the Exeter Hospital can attend the practice of the Eye Infirmary. Patients for the year ending Michaelmas, 1908, 2947.

THE GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION, Gloucester.—This hospital, which was granted the title of "Royal" on the occasion of the King's visit this year, has 140 beds. Consulting Surgeons: Mr. J. P. Wilton, Mr. T. S. Ellis, Mr. R. M. Cole, and Mr. H. E. Waddy. Physicians: Dr. C. W. Clark and Dr. W. W. Grosvenor. Assistant Physician: Dr. D. E. Finlay. Surgeons: Mr. E. D. Bower, Mr. W. Washbourn, and Mr. G. W. Ancrum. Ophthalmic Surgeon: Mr. E. D. Bower. Assistant Surgeon: Mr. C. V. Knight. Secretary: H. P. Pike. In-patients, 1365; out-patients, 8788.

NORTH STAFFORDSHIRE INFIRMARY AND EYE HOSPITAL, Hartshill, Stoke-on-Trent.—The New Infirmary, opened in 1869, is built on the pavilion plan, has accommodation for over 200 patients, including Children's wards, special *Ovarian wards, and a special department for the treatment of* Diseases of the Eye, so that there are unusual facilities for acquiring a practical knowledge of the profession. Physicians: Dr. H. Nicholls and Dr. S. King Alcock. Surgeons: Dr. G. Stokes Hatton and Dr. Wheelton Hind. [illegible] and Dr. W. E. L. [illegible] Alcock and Dr. [illegible] Mr. Herbert H. [illegible] R. H. Dickson. [illegible] Department: Dr. [illegible] Secretary, *pro* [illegible]

HULL ROYAL INFIRMARY, Hull.—This hospital contains 249 beds. Consulting Physician: Dr. Edward O. Daley. Consulting Surgeons: Sir John Sherburn, Mr. Thomas M. Evans, and Mr. Robert H. B. Nicholson. Physicians: Dr. Frank Nicholson, Dr. Frank C. Eve, and Dr. Edward Turton. Surgeons: Mr. Edmund H. Howlett, Mr. Alfred G. Francis, Mr. *Henry W. Pigeon*, and Mr. Edward Harrison. Ophthalmic Surgeon: Dr. William C. Rockliffe. Assistant Ophthalmic Surgeon: Mr. A. L. Roe. Assistant Surgeons: Mr. Harold Upcott, Mr. Edward M. Hainworth, Mr. Robert Grieve, and Mr. Guy B. Nicholson. Dental Surgeon: Mr. John C. Storey.

LEICESTER INFIRMARY, Leicester.—Instruction in the infirmary for first-year students is duly recognised by the various examining bodies. At the General Infirmary there are 198 beds (to be shortly increased to 230), and at the Children's Hospital in connexion 42; total 240. A new wing containing 100 beds has recently been opened by H.R.H. the Duchess of Argyll. A new Nurses' Home containing separate accommodation for 110 [illegible] There are eight [illegible] Sir Charles [illegible] sicians: Dr. [illegible] ey V. Clarke. [illegible] Douglas, Mr. [illegible] Ophthalmic [illegible] urgeon: Dr. [illegible]: Dr. Robert Sevester and Dr. Thomas V Crosby. Assistant Surgeons: Mr. John S. Sloane and Mr Felix B. Carter. House Governor and Secretary, Mr. Harry Johnson.

NORTHAMPTON GENERAL HOSPITAL, Northampton.—Two new wings were opened in 1904 and the old buildings entirely renovated and re-arranged. The number of beds is 166. Non-resident pupils are received and have every opportunity of acquiring a practical knowledge of their profession. The fee is £10 10*s*. Pupils can be received at any time. Physicians: Dr. Frank Buszard and Dr. Peverell S. Hichens. Surgeons: Mr. George H. Percival and Mr. R. A. Milligan. Ophthalmic Surgeon: Mr. E. Harries Jones. Assistant Physician: Dr. W. M. Robson. Assistant Surgeon: Mr. N. Blake Odgers. Dental Surgeon: Mr. E. Rogers Bull.

NORFOLK AND NORWICH HOSPITAL, Norwich.—This hospital has 210 beds. Non-resident pupils admitted. Fees: For three months, £3 3*s*.; for six months, £5 5*s*.; as permanent pupil, £8 8*s*. Consulting Physician: Sir P. Eade. Consulting Surgeons: Dr. Beverley and Mr. H. S. Robinson. Physicians: Dr. Barton, Dr. Burton-Fanning, and Dr. Long. Surgeons: Mr. S. H. Burton, Mr. D. D. Day, and Mr. H. A. Ballance. Assistant Physician: Dr. A. J. Cleveland. Assistant Surgeons: Mr. E. W. Everett and Mr. A. J. Blaxland. Dental Surgeon: Mr. H. F. White. Electro-Therapeutist: Dr. A. J. Cleveland. Secretary: Mr. F. G. Hazell.

NOTTINGH[illegible] 241 beds. [illegible] Physicians: [illegible] and Dr. Frank H. Jacob. Assistant Physicians: Dr. James C. Buckley and Dr. William T. Rowe. Consulting Surgeons: Mr. Thomas Wright and Mr. R. C. Chicken. Surgeons: Dr. H. Owen Taylor, Mr. Alexander R. Anderson, Mr. Joseph Thompson, and Mr. Robert G. Hogarth. Assistant Surgeons: Mr. W. Morley Willis and Mr. Charles H. Allen. *Dental Surgeon*: Mr. George W. Harris.

SOUTH DEVON AND EAST CORNWALL HOSPITAL, Plymouth.—This hospital contains 155 beds. Consulting Physician: Dr. R. H. Clay. Physicians: Dr. E. L. Fox and Dr. A. B. Soltau. Consulting Surgeons: Mr. P. Swain and Mr. Connell Whipple. Surgeons: Mr. W. L. Woollcombe, Mr. R. H. Lucy, and Mr. H. W. Webber. Assistant Surgeons: Mr. C. E. R. Rendle, Mr. G. F. Aldous, and Mr. [illegible] Mr. E. G. Smith, and Mr. G. C. F. Robinson. Dental Surgeon: Mr. G. R. Brittan.

THE ROYAL HOSPITAL, Portsmouth (founded 1847).—The number of beds is 132. Honorary Physicians: Dr. John Phillips and Dr. C. C. Claremont. Surgeons: Mr. C. P. Childe, Mr. T. A. M. Forde, and Mr. A. B. Wright. Honorary Anæsthetist: Dr. W. J. Essery. Honorary Assistant Physicians: Dr. W. P. McEldowney, Dr. J. T. Leon, and Dr. E. J. Davis Taylor. Honorary Assistant Surgeons: Mr. L. Cole Baker, Mr. [illegible] The hospital is a pr[illegible] gery; the attendanc[illegible] by the Examining [illegible] at the hospital.

ROYAL BERKSHIRE HOSPITAL, Reading.—This hospital contains 168 beds. Consulting Surgeon: Mr. James H. Walters. Physicians: Dr. Charles W. Marriott and Dr. Francis H. Hawkins. Assistant Physicians: Dr. William T. Freeman and Dr. George S. Abram. Surgeons: Mr. William [illegible] P. Price. Assistant Surgeons: Dr. [illegible] Mr. William J. Foster. Aural [illegible] rts. Ophthalmic Surgeon: Mr. Richard P. Brooks. Consulting Dental Surgeon: Mr. Allan L. Goadby.

SALISBURY GENERAL INFIRMARY, Salisbury.—This hospital contains 120 beds. Consulting Physician: Dr. G. G. Morrice. Physicians: Dr. W. W. Ord and Dr. E. T. Fison. Surgeons: Mr. L. S. Luckham, Dr. C. G. B. Kempe, and Mr. H. L. E. Wilks. Surgeon Dentist: Mr. H. L. Farebrother. Secretary: Mr. S. B. Smith. In-patients, 77 weekly; out-patients, 1071; casualties, 1851; dental cases, 371. Assistant Secretary, Mr. G. F. Henbest.

SALOP INFIRMARY, Shrewsbury.—This hospital has 120 beds. Consulting Physicians: Dr. H. N. Edwards, Dr. E. Burd, Dr. R. W. C. Withers, and Dr. E. Lycett Burd. Physicians: Dr. E. Cureton, Dr. H. W. Gardner, and Dr. R. H. Urwick. Consulting Surgeon: Mr. W. Eddowes. Surgeons: Mr. A. Jackson, Mr. H. H. B. MacLeod, and Mr. L. J. Godson. Ophthalmic Surgeon: Mr. C. G. Russ Wood. Pathologist: Dr. T. L. Webb. Radiographer: Mr. C. E. Salt. Dental Surgeon: Mr. W. E. Harding. Secretary: Mr. Joseph Jenks. In-patients, 1239; out-patients, 2546. Out-patient attendances, 21,055.

ROYAL SOUTH [illegible] AL, Southampton.—T[illegible] ysi-cians: Dr. J. L. [illegible] ant Physicians: Dr. [illegible] Dr. B. N. Tebbs. Su[illegible] and Mr. A. B Wade. [illegible] R. Keele, *and* Mr. [illegible] G. H. Cowen. Th[illegible] Dental Surgeon: [illegible] Department: Dr. N. E. Aldridge. Secretary: Mr. T. A. Fisher-Hall. In-patients, 1946; out-patients, 8900

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—This hospital has 77 beds. Honorary Consulting Physician: Dr. G. Reid. Physicians: Dr. C. Reid and Dr. W. F. Annand. Surgeons: Mr. F. M. Blumer and Mr. F. H. Marson. Assistant Honorary Surgeon: Mr. F. N. Cookson. Ophthalmic Surgeon: Mr. A B Cridland. Surgeon Dentist: Mr. W. H. Ridge. Secretary: Mr. R. Battle. In-patients, 898; out-patients, 4126.

ROYAL HANTS COUNTY HOSPITAL, Winchester.—This hospital has 108 beds. Honorary Consulting Physicians: Dr. W. M. Harman and Dr. H. E. Wingfield. Physicians: Dr. G. F. A. England, Dr. A. E. Bodington, and Dr. G. A. Tullis. Surgeons: Mr. C. Wace, Mr. H. J. Godwin, and Mr. F. J. Child. Honorary Ophthalmic Surgeon: Mr. J. F. Bullar. Honorary Dental Surgeon: Mr. L. M. Balding. Honorary Secretary: Captain W. Casey, R.N. Assistant Secretary: Mr. A. D. White.

WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL, Wolverhampton.—There are 200 beds. Special departments for Children, Gynæcology, Ear, Throat, and Nose Diseases, Electro-therapeutic and X ray departments. There is an excellent library. The resident officers are a resident surgical officer, a resident medical officer, and two house surgeons. Pupils are allowed to witness the whole of the practice of the hospital and to be present at operations and have every opportunity of acquiring a practical knowledge of their profession. Fees: £3 3*s*. a quarter, £10 10*s*. the first year, and £5 5*s*. subsequent years. A course of Practical Pharmacy is given by the dispenser. Fee £3 3*s*. for three months. Applications should be made to the Secretary of the Medical Committee.

Staff.—Consulting Physician: Dr. W. Millington. Consulting Surgeon: Mr. W. H. T. Winter. Physicians: Dr. H. Malet and Dr. J. A. Codd. Surgeons: Mr. E. Deanesly, Mr. A. H. Hunt, and Mr. W. F. Cholmeley. Assistant Physicians: Dr. A. H. Carter, Dr. E. H. Coleman, and Dr. T. H. Galbraith. Assistant Surgeon: Mr. H. Dent.

WORCESTER GENERAL INFIRMARY, Worcester.—This hospital has 132 beds. Consulting Physician: Dr. E. H. W. Swete. Physicians: Dr. G. W. Crowe, Dr. M. Read, and Dr. H. A. Watson. Consulting Surgeon: Mr. G. E. Hyde. Surgeons: Mr. T. Bates, Mr. T. P. Gostling, and Mr. O. Pollard. Secretary: Mr. W. Stallard. In-patients, 1339; out-patients, 6501.

YORK COUNTY HOSPITAL, York.—This hospital contains 150 beds. Consulting Physician: Dr. Richard Petch. Physicians: Dr. Richard Turner, Dr. William A. Evelyn, and Dr. J. S. Gayner. Surgeons: Mr. William H. Jalland, Mr. Frederick Shann, Mr. G. Wilfred Gostling, and Dr. Noel L. Hood. Consulting Ophthalmic Surgeon: Dr. Tempest Anderson. Ophthalmic Surgeon: Dr. Peter Macdonald. Electro therapeutic Department: Mr. Hinton E. Bateman. Anæsthetist: Mr. Gerald S. Hughes. Dental Surgeons: Mr. Walter Glaisby and Mr. Leonard A. Glaisby.

II.—SCOTLAND.

THE UNIVERSITIES.

UNIVERSITY OF EDINBURGH.

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.). The degree of Bachelor of Surgery cannot be conferred on any person who does not at the same time obtain the degree of Bachelor of Medicine, and similarly the degree of Bachelor of Medicine is not conferred on any person who does not at the same time obtain the degree of Bachelor of Surgery.

A diploma in Tropical Medicine and Hygiene (D.T.M. and H.) is granted to graduates in Medicine and Surgery of the University of not less than six months' standing. The course of study includes (1) Practical Bacteriology; (2) Diseases of Tropical Climates; (3) Tropical Hygiene; (4) a Practical Course in Medical Entomology and Protozoology and Venomous Animals; and (5) a Course of Clinical Instruction in Tropical Diseases. Any two of these courses may be taken under Extra-academical Teachers and exemption from the latter course may be granted to those graduates who have been engaged for a period of at least 12 months in the treatment of Tropical Diseases in any tropical or subtropical country. The examinations for the diploma, which will embrace all the foregoing subjects, are held in December and July of each year.

Before commencing his medical studies each student must pass a preliminary examination in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek or French or German: provided always that, in the case of a candidate whose native language is not English, an examination in the native language of the candidate may be substituted for one in either French or German, and an examination in any other classical language for one in Latin or Greek.

No one is admitted to the degrees of *Bachelor of Medicine* and *Bachelor of Surgery* who has not been engaged in Medical and Surgical study for five years. No course of lectures will be allowed to qualify unless the lecturer certifies that it has embraced at least 100 lectures, or 50 lectures, as may be required by the regulations, and that the student has also duly performed the work of the class.

Candidates for the degrees of M.B. and Ch.B. must have attended for at least three academic years the medical and surgical practice either of the Royal Infirmary, Edinburgh, or of a general hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons. They must have attended Clinical Surgery during a course or courses extending over not less than nine months. These courses may be conducted by the professor of clinical surgery, or by professors or lecturers appointed for the purpose by the University Court, or by the ordinary surgeons of the Royal Infirmary, Edinburgh, or of a general hospital defined and recognised as hereinbefore provided, and shall consist of regular instruction at the bedside, along with clinical lectures. A similar course of clinical medicine during a course or courses extending over not less than nine months is required. The candidate must have attended a course of instruction in Mental Diseases given by the University Lecturer, or by a recognised Teacher, consisting of not less than six Class-room meetings for lectures and demonstrations and ten meetings in the Wards of a recognised Asylum for the insane. The candidate must have attended a course of 25 meetings on Practical Pharmacy in a university or recognised school of medicine, or have dispensed drugs for a period of three months in a hospital or dispensary, or in an establishment recognised by the *Pharmaceutical* Society. The candidate must have attended for at least six months, by apprenticeship or otherwise, the out-practice of a hospital, or the practice of a dispensary, or of a physician or surgeon, or of a member of the London or Dublin Society of Apothecaries. He must have acted as clerk in the medical wards and dresser in the surgical wards of a public hospital for a period of six months in each case; and must also have availed himself, to such an extent as may be required by the Senatus, with the approval of the University Court, of opportunities of studying at a hospital or dispensary, Post-mortem Examinations, Fevers, Diseases of the Eye, Operative Surgery, and one of the three following—viz.: Diseases of Children; Diseases of the Larynx, Ear, and Nose; and Diseases of the Skin, or such other special departments as may from time to time be determined. The candidate must have attended, under the superintendence of a registered medical practitioner, 25 cases of labour, or such additional number as the Senatus, with the sanction of the University Court, may from time to time determine; or have attended for three months the practice of a lying-in hospital, or of the maternity department of a general hospital or other public charitable institution and have conducted personally 12 or such an additional number of cases of labour as the Senatus, with the approval of the University Court, may from time to time determine. The candidate must have been properly instructed in Vaccination at a public vaccination station, by a public vaccinator, authorised by the proper Government authority to grant certificates of proficiency in vaccination.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations have effect:—Two of the five years of medical study must be spent in the University of Edinburgh. The remaining three years may be spent in any University of the United Kingdom, or in any Indian, Colonial, or Foreign university recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University

Court. Of the subjects of study, 16 in number—viz., Anatomy, Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica, Physiology, Practical Physiology, Practice of Medicine, Surgery, Midwifery and Diseases of Women, Pathology, Practical Pathology, Physics, Botany, Zoology, Medical Jurisprudence, and Public Health—not less than eight must be taken in the University of Edinburgh, which corresponds to the two years above referred to.

Women are admitted to graduation in medicine under practically the same conditions as men, excepting that, until provision is made in the University for instruction of women in all subject[illegible] to places of [illegible] not apply to [illegible] their instruction from recognised Extra-Academical Teachers, who are Lecturers in the School of Medicine for Women, Surgeons' Hall.

Each candidate is examined, both in writing and orally, and clinically where the nature of the subject admits:—*First*, in Chemistry, Zoology, Botany, and Physics; *second*, in Anatomy and Physiology; *third*, in Materia Medica and Therapeutics and Pathology; and *fourth*, in Surgery, Medicine, Midwifery, Forensic Medicine, and Public Health, and clinically in Medicine, Surgery, and Gynæcology in a hospital. The examinations are conducted, as far as possible, by demonstrations of objects placed before the candidates. Candidates who profess themselves ready to submit to an examination in the first division of these subjects may be admitted to examination therein at the first period of examination after they have completed their attendance on the necessary classes. Candidates who have passed their examination in the first division of these subjects may be admitted to examination in the second division at the end of their third winter session. Candidates who have passed their examinations in the subjects comprised in the first and second divisions may be admitted to examination in the third division at the end of the fourth winter session. Candidates who have passed their examinations in the subjects comprised in the first, second, and third divisions may be admitted to examination in the fourth or final division when they have completed the fifth year of study.

Under a new medical ordinance it is provided that candidates may pass all or any of the subjects of the first division—viz., Botany, Zoology, Physics, or Chemistry—at a university in the United Kingdom or at any other university approved by the Senate for this purpose, when such subjects qualify for a degree in arts or science. In the second division the examination in Physiology may be taken at any time and in Anatomy at any time after the first half session of the third winter session. In the third division the examination in Pathology may be taken at any time after the end of the third summer session in the case of students who begin the medical curriculum in October and at the end of the fourth summer session in the case of students who begin their medical curriculum in May. In Materia Medica the examination may be taken at any time after the end of the fourth winter session. Candidates may be admitted to examination in Practical Pharmacy and in the physical, chemical, and botanical characters of medicinal substances at any examination held after they have completed the qualifying course of study. In the fourth division a student after taking the prescribed courses of study may be examined in Forensic Medicine and Public Health at any time, in Midwifery at any time after the end of the first half session, of the fifth winter session, in the Practice of Medicine and Surgery at any time after the end of the fifth winter session, and in Clinical Medicine (including the subject of Diseases Peculiar to Women) and Clinical Surgery at the end of the fifth year of study. This new ordinance applies to students who entered the University at or after the beginning of the winter session 1907, but students who entered before that date have the option of finishing their course under the existing regulations or of taking advantage of the new ordinance.

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery is £23 2*s*., and the proportion of this sum to be paid by a candidate at each division of the examination shall be as follows—viz.: For the First Division of the Examination (Botany, Zoology, Physics, and Chemistr[illegible] and Physiolog[illegible] and Materia [illegible] Final Division [illegible] Clinical Medicine, Midwifery, Clinical Gynæcology, and Forensic Medicine and Public Health), £7 7*s*.

Bachelors of Medicine and *Bachelors of Surgery* may proceed to the degrees of *Doctor of Medicine* and *Master of Surgery* after they have spent one year in the medical or surgical wards respectively of a hospital, or the Military or Naval Medical Services, or in scientific work bearing directly on their profession, or two years in practice. In each case an examination must be passed and a thesis submitted for approval of the Faculty. The fee to be paid for the degree of M.D. is £10 10*s*., and the fee to be paid for the degree of Ch.M. is £10 10*s*.

Professors—Natural Philosophy: J. G. Macgregor, D.Sc. Materia Medica: Sir Thomas R. Fraser, M.D., F.R.S. Forensic Medicine: Harvey Littlejohn, M.B., F.R.C.S.E. Chemistry: James Walker, D.Sc., F.R.S. Surgery: Alexis Thomson, M.D. Medicine: J. Wyllie, M.D. Anatomy: Arthur Robinson, M.D. Pathology: William Smith Greenfield, M.D. Midwifery: Sir John Halliday Croom, M.D. Clinical Medicine: Sir T. R. Fraser, W. S. Greenfield, and J. Wyllie. Clinical Surgery: F. M. Caird, M.B., F.R.C.S. Botany: I. Bayley Balfour, M.D. Physiology: E. A. Schäfer, F.R.S. Zoology: J. Cossar Ewart, M.D. Public Health, &c.: C. Hunter Stewart, M.B., D.Sc

Scholarships and Prizes.—In the University of Edinburgh many bursaries, scholarships, prizes, &c., are given, some of which, by the nature of the subject or by the conditions attached, are restricted to Medical Students, while others are open to Students in two or more Faculties, of which Medicine may be one. In the following list the money value, the subjects of examination, or other system of selection, and any special conditions that may be imposed, are placed in that order. As "continued study" is a condition in a considerable proportion of the cases it has not been thought necessary to repeat these words.

For Students entering on or in their First Year.—Sibbald Bursaries for entrants, one or two annually, tenable for three years, each £30 per annum, Preliminary Subjects; Heriot Bursaries for entrants, seven for men and one for women annually, tenable for three years, each £30 per annum, Preliminary Subjects; Thomson Bursary, £25 per annum, tenable for four years, Distinction in Medical Preliminary Examination; Grierson Bursary No. 1, £20, Distinction in Medical Preliminary Examination; Crichton Bursaries, two annually, tenable for four years, each £50 per annum, Distinction in Medical Preliminary Examination with extra subjects, birth in Scotland; Mackie Bursary No. 1, tenable for two years, £30 per annum, vote of Faculty, need of pecuniary aid; Junior J. A. Carlyle Bursary, £28, Class Examinations in Anatomy and Chemistry; Coldstream Memorial Scholarship for intending Medical Missionaries, tenable for five years, £25 per annum; three Vans Dunlop Scholarships, Nos. 1, 2, and 3, each tenable for three years, £100 per annum, one for first place in Medical Preliminary Examination, one for Chemistry and Physics, one for Botany and Zoology; Thomson Scholarship, tenable for four years, £40 per annum, Botany, Zoology, and Mechanics.

For Students entering on or in their Second Year.—Mackie Bursary No. 2, tenable for two years, £30 per annum, vote of Faculty, need of pecuniary aid; Grierson Bursary No. 2, £20, Chemistry, Botany, Zoology, and Physics; Senior J. A. Carlyle Bursary, £28, Class Examinations in Anatomy and Physiology; Sibbald Scholarship, tenable for three years, £40 per annum, Chemistry, Botany, Zoology, and Physics; Vans Dunlop Scholarship No. 4, tenable for three years, £100 per annum, Physiology; *Neil Arnott Prize, £37 10s.*, Distinction in Natural Philosophy in the M.A. Examination.

For Students entering on their Third Year.—Grierson Bursary No. 3, £20, Anatomy and Physiology.

For Students entering on their Fourth or Fifth Year or for Graduates.—Syme Surgical Fellowship, tenable for two years, £100 per annum, Thesis by M.B. of not more than three years' standing; Goodsir Memorial Fellowship, tenable for two years, £100 per annum, Thesis by M.B., &c., of not more than three years' standing; Leckie Mactier Fellowship, tenable for three years, £80 per annum, competition among M.B.'s of not more than three years' standing; Freeland Barbour Fellowship, £100, highest marks in Anatomy, [illegible] four Vans Dunlop [illegible] for three years, £100 per annum, one in Anatomy, one in Pathology and Surgery, one in Materia Medica and Medicine, and one in Forensic Medicine, Public Health, and Midwifery; Murchison Memorial Scholarship, interest on £1000, Clinical Medicine; Stark Scholarship, £112, Clinical Medicine, with Research in Clinical Medicine as a condition; Buchanan Scholarship, £40, Midwifery and Gynæcology, with work in gynæcological ward as a condition; James Scott Scholarship, £32 10*s.*, Midwifery, with work in maternity hospital as a condition; Ettles Scholarship for the most distinguished M.B., Ch.B. of the year, £31; Crichton Research Scholarships in Anatomy, Physiology, Materia Medica, and Pathology, tenable for one, two, or three years, £100 each per annum, competition among graduates; Mouat Scholarship, £55 and medal, Class and Degree Examinations in Practice of Physic; two Grierson Bursaries, Nos. 4 and 5, £10 each, one in Materia Medica and one in Pathology; McCosh Graduate's Bursary and McCosh Medical Bursary for Research, income of £5500, Distinction in Professional Subjects and Knowledge of Foreign Languages, with the condition of Study or Research in Medical Schools of Europe; Gunning Victoria Jubilee Prizes, two awarded annually, each £50, Thesis or Original Research in Anatomy, Physiology, Zoology, Botany, Chemistry, Materia Medica, Surgery, Practice of Physic, Pathology, Obstetrics and Medical Jurisprudence, and Public Health respectively; Theses Gold Medals for the best Theses for the M.D. degree; Conan Doyle Prize for the most distinguished Graduate of the year from South Africa, £32; Wightman Prize, £12, Clinical Reports on Medical Cases; Beaney Prize, £32 10*s.*, highest marks in Anatomy, Surgery, and Clinical Surgery, in M.B. and Ch.B. Examinations; Ellis Prize, £28, Essay on Animal or Vegetable Physiology; Cameron Prize, for the most valuable addition to Practical Therapeutics during the preceding five years, annual proceeds of £2000; Milner Fothergill Gold Medal, about £20, Essay on Pharmacological or Therapeutic subject; Mackay Smith Scholarship for Students in Chemistry, tenable for two years, £25 per annum; Houldsworth Scholarship for Students or Graduates, £40, Materia Medica, with the condition of Research in Pharmacology; Mackenzie Bursaries, two annually, £20, Practical Anatomy; Pattison Prize, about £11 7*s.* 6*d.*, Clinical Reports of Surgical Cases; Dobbie Smith Gold Medal for a Botanical Essay; Anderson Henry Prize for a Botanical Essay, proceeds of £300 accumulated for three years; Gilfillan Memorial Prize for the most distinguished Woman Graduate of the year, about £10.

SCHOOL OF MEDICINE OF THE ROYAL COLLEGES, Edinburgh.—The number of students varies much in the classes and subjects. It is within the limit to say that about 1000 students avail themselves each session of the opportunity of attending the school. The lectures qualify for the University of Edinburgh and other Universities, the Royal Colleges of Physicians and Surgeons of London, Edinburgh, and Dublin, the Faculty of Physicians and Surgeons of Glasgow, and other Medical and Surgical and Public Boards. A post-graduate vacation course commences on August 31st.

The anatomy rooms and laboratories will open on Friday, Oct. 1st, and the lectures will commence on that date.

In accordance with the statutes of the University of Edinburgh one-half of the qualifying classes required for graduation may be attended in this school, in addition to the class of Practical Materia Medica and the classes of Clinical Medicine and Clinical Surgery. The regulations require that the fee for any class taken for graduation in Edinburgh shall be the same as that for the corresponding class in the University. The whole education required for graduation at the University of London may be taken in this school.

The appointment of Resident Physician to the wards in the Royal Infirmary under the care of the Ordinary Physicians is open to those members of their clinical class who have held the office of clerk in their wards for at least six months. Six Residentships are appointed for a period of six months each. Resident Surgeons are also appointed by the Ordinary Surgeons to the Hospital. In all respects the students are taught under regulations similar to those at the University of Edinburgh and the other Universities of Scotland, and they receive similar certificates at the close of each session. Moreover, the University and College authorities in Edinburgh and the governing board of the school call upon each recognised lecturer to supply them at the close of each session with a statement giving the number of students attending the class, the number of lectures or prelections delivered during the session, the class examinations held, and the general mode of conducting the class. The courses on special non-qualifying subjects have for the last quarter of a century formed a marked feature of the school. Indeed, such medical subjects could be studied in Edinburgh only in this school until lately, when the University of Edinburgh appointed from the school lecturers on Diseases of the Eye, Insanity, and Diseases of Children to take charge of classes intra-murally. A list of the classes and lecturers will be found below. Special courses of instruction for dental students and for women are also included in the curriculum of this school. The classes of the school are conducted in several separate buildings, such as at Surgeons' Hall, Minto House, Nicolson-square, and the New School, Bristo-street.

Lecturers and Fees.—Winter Session: Anatomy, Practical Anatomy, and Demonstrations, Dr. Ryland Whitaker (£3 5*s.* and £4 4*s.*); Chemistry (Practical, &c.), Mr. Gemmell and Dr. T. W. Drinkwater*; Physiology (Institutes of Medicine), Dr. Alex. Goodall (£3 5*s.*); General Pathology, &c., Dr. Shennan and Dr. James Miller (£3 5*s.*); Biology, Mr. Malcolm Laurie (£3 5*s.*); Zoology, Mr. Malcolm Laurie; Physics, Dr. Dawson Turner (£3 3*s.*); Bacteriology, Dr. Taylor Grant, Dr. Theodore Shennan, and Dr. James Miller; Practice of Physic, Dr. Gibson, Dr. Bruce, Dr. Philip, Dr. R. A. Fleming, Dr. Lovell Gulland, Dr. W. Russell, and Dr. Harry Rainy (£3 5*s.*); Surgery, Mr. Hodsdon, Mr. Wallace, Mr. Miles, Mr. Scot Skirving, Mr. Dowden, and Mr. Chiene (£3 5*s.*); Materia Medica, &c., Dr. Craig and Dr. F. D. Boyd† (£3 5*s.*); Midwifery, &c., Dr. Hart, Dr. Ballantyne, Dr. Haultain, Dr. Haig Ferguson, Dr. Fordyce, Dr. Lamond Lackie, Dr. Elsie Inglis, Dr. McGibbon, and Dr. Barbour Simpson (£3 5*s.*); Medical Jurisprudence, &c., Dr. Aitchison Robertson (£3 5*s.*); Public Health, Dr. Aitchison Robertson and Dr. W. Robertson; Hospital Practice (Edinburgh Royal Infirmary): Physicians, Dr. Bramwell, Dr. Gibson, Dr. Bruce, Dr. Philip, Mr. Wallace, and Dr. Brewis for Gynæcology; Surgeons, Mr. Cotterill, Mr. Cathcart, and Dr. Hodsdon (perpetual ticket, £12); Clinical Medicine, Dr. Byrom Bramwell, Dr. Gibson, Dr. Bruce, and Dr. Philip; Dr. Brewis for Gynæcology (£3 5*s.*); Clinical Surgery, Mr. Cotterill, Mr. Cathcart, Mr. Hodsdon, and Mr. Wallace (£3 5*s.*); Diseases of the Chest, Dr. Philip† and Dr. Lovell Gulland (£2 2*s.*); Vaccination, Dr. Buist† and Dr. W. G. A. Robertson (£1 1*s.*); Diseases of Ear, Nose, and Throat, Dr. J. Malcolm Farquharson and Dr. J. S. Fraser (£2 2*s.*); Diseases of the Eye, Dr. Sym† and Dr. J. V. Paterson (£2 2*s.*); Ophthalmoscopy, Dr. A. H. H. Sinclair (£2 2*s.*); Gynæcology, Dr. Haig Ferguson and Dr. Elsie M. Inglis (Systematic), Dr. Brewis and Dr. J. Haig Ferguson (Clinical), and Dr. J. W. Ballantyne (Advanced) (£2 2*s.*); Neurology, Dr. J. J. Graham Brown (£2 2*s.*); Clinical Methods, Dr. W. Russell (£2 5*s.*); Medical Electricity, Dr. Dawson Turner (£2 12*s.* 6*d.*); Tropical Diseases, Major D. G. Marshall, I.M.S. (£2 2*s.*). Summer Session: Practical Anatomy and Demonstrations, Dr. Ryland Whitaker (£2 2*s.*); Practical Physiology, Dr. Goodall (£3 3*s.*); Biology, Mr. M. Laurie‡ and Miss Newbigin (£3 3*s.*); Practical Chemistry and Analytical Chemistry, Mr. Gemmell and Mr. Drinkwater §; Practical Bacteriology, Dr. Shennan, Dr. Taylor Grant, and Dr. James Miller; Materia Medica, Dr. Craig and Dr. F. D. Boyd; Diseases of the Eye, Dr. Sym and Dr. J. V. Paterson (£2 2*s.*); Medical Psychology and Insanity, Sir J. Batty Tuke and Dr. John Keay (£2 2*s.*); Medical Jurisprudence, Dr. Aitchison Robertson; Public Health, Dr. Wm. Robertson (£2 2*s.*); Gynæcology, Dr. Brewis (£2 2*s.*); Midwifery Lectures, Dr. Ballantyne, Dr. Haig Ferguson, Dr. W. Fordyce, Dr. Lamond Lackie, Dr. Elsie Inglis, Dr. McGibbon, and Dr. Barbour Simpson (£3 5*s.*); Operative Surgery, Mr. Hodsdon, Mr. Alex. Miles, Mr. Dowden, Mr. Scot Skirving, and Mr. Chiene (£3 3*s.*); Practical Pathology, Dr. Shennan and Dr. James Miller (£3 3*s.*); Physics, Dr. Turner‡ (£3 3*s.*); Practical Medicine and Physical Diagnosis, Dr. Fleming; Dr. Lovell Gulland, and Dr. Harry Rainy (£3 3*s.*); Clinical Medicine, Dr. Bramwell and Dr. Gibson (£2 2*s.*), Vaccination, Dr. Buist and Dr. W. G. A. Robertson (£1 1*s.*); Neurology, Dr. Bruce and Dr. Graham Brown; Diseases of Ear, Nose, and Throat, Dr. J. Malcolm Farquharson and Dr. J. S. Fraser (£2 2*s.*); Tropical Diseases, Major D. G. Marshall, I.M.S. (£2 2*s.*); Medical Electricity, Dr. Dawson Turner.

Special Classes for Women, Winter Session: Practical

Anatomy and Demonstrations, Dr. Ryland [illegible] (£4 4s.); Chemistry (Lectures and Practica[illegible] T. W. Drinkwater (£3 5s. and £3 3s.); Practice of [illegible] Dr. W. Russell (£3 5s.); Surgery, Mr. Wade ([illegible]; Midwifery and Diseases of Women, Dr. J. W. Bal[illegible] General Pathology, Dr. James Miller (£3 5s.); Pl[illegible] (Institutes of Medicine), Dr. Goodall (£3 5s.); Materia Medica, &c., Dr. Craig (£3 5s.); Clinical Medicine, Dr. W. Russell, Royal Infirmary (£3 5s.); Clinical Surgery, Mr. Wallace, Royal Infirmary (£3 5s.); Physics, Dr. Dawson Turner (£3 3s.); Vaccination, Dr. Buist and Dr. W. G. A. Robertson (£1 1s.); Practical Gynæcology, Dr. Brewis (£2 2s.); Diseases of the Eye, Dr. W. G. Sym; Bacteriology, Dr. J. Taylor Grant; Tropical Diseases, Major D. G. Marshall; Fevers, City Hospital. Summer Session: Practical Anatomy, Dr. Ryland Whitaker (£2 2s.); Practical Chemistry, Dr. T. W. Drinkwater (£3 3s.); Materia Medica, &c., Dr. Craig and Dr. F. D. Boyd (£3 3s.); Operative Surgery and Surgical Anatomy, Mr. H. Wade (£3 3s.); Materia Medica and Therapeutics, Dr. Wm. Craig (£3 3s.); Practical Materia Medica, Dr. Wm. Craig and Dr. Boyd; Medical Jurisprudence and Public Health, Dr. Aitchison Robertson (£3 5s.); Public Health, Dr. W. Robertson; Clinical Medicine, Dr. W. Russell; Clinical Surgery, Mr. Wallace, Royal Infirmary (£3 5s.) [illegible] Histology, Dr. Goodall (£3 3s.); [illegible] James Miller (£3 3s.); Biology, [illegible] Physics, Dr. Dawson Turner (£3 [illegible] A. H. H. Sinclair (£2 2s.); Ins[illegible] and Dr. John Keay (£2 2s.); [illegible] Dr. J. W. Ballantyne (£2 2s.); [illegible] Philip and Dr. G. Lovell Gulland; Practical Medicine, Clinical Methods, Dr. W. Russell; Vaccination, Dr. W. G. A. Robertson; Tropical Diseases, Major Marshall; Medical Electricity, Dr. Dawson Turner.

The minimum cost of the education in this School of Medicine for the Triple Qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, including the fees for the Joint Examinations, is about £115, payment of which is distributed over the period of study. There is no composition fee.

Further particulars regarding the school, also its calendar, may be had on application to the Dean of the School, 11, Bristo-place, Edinburgh.

THE EDINBURGH SCHOOL OF MEDICINE FOR WOMEN.—The Edinburgh School of Medicine for Women provides all the classes required for a complete curriculum. The classes qualify for the University Degree in Medicine, for the Diploma of the Royal Colleges, and for the Triple Qualification. The lecturers of the school are specially recognised by the Court of Edinburgh University for the education of women who propose taking the degree in medicine of the University of Edinburgh. Most of the classes are held in Surgeons' Hall. The office [illegible] and other conveniences are [illegible] the use of the women stud[illegible] the students is conducted [illegible] mary, specially set apart for the purpose; in the Royal Hospital for Sick Children; in the City Hospital for Infectious Diseases; at Bangour Asylum; and at the various public dispensaries. The fees and the regulations as to the course of study are the same as for the male students. Further particulars can be obtained from the Dean of the School of Medicine for Women, Surgeons' Hall, Edinburgh.

Clinical Instruction.—ROYAL INFIRMARY, Edinburgh.—This hospital has over 900 beds and 60 cots for children, the average daily number of patients for 1908 being 836. Beds are set apart for clinical instruction by the professors of the University of Edinburgh. Courses of Clinical Medicine and Surgery are also given by the ordinary physicians and surgeons. Special instruction is given on Diseases of Women, Physical Diagnosis, Diseases of the Skin, Diseases of the Eye, the Ear, the Larynx, and the Teeth. Separate wards are devoted to Venereal Diseases, Diseases of Women, Diseases of the Eye, the Ear, Throat and Nose, and the Skin, and also to cases [illegible] logical Ana[illegible] es for hospital attendance [illegible] ticket, in one payment, £12; annual ticket, £6 6s.; six months, £4 4s.; three months, £2 2s.; monthly, £1 1s. Separate payments amounting to £12 12s. entitle the student to a life ticket. No fees are paid for any medical or surgical appointment. The appointments are as follows:—1. Resident physicians and surgeons are appointed and live in the house free of charge. The appointment is for six months but may be renewed at the end of that period by special recommendation. 2. Non-resident house physicians and surgeons and clinical assistants are appointed for six months. The appointment may be renewed for a like period by special recommendation. 3. Clerks and dressers are appointed by the physicians and surgeons. These appointments are open to all students and junior practitioners holding hospital tickets. 4. Assistants in the Pathological Department are appointed by the pathologist.

Staff: Medical Department.—Consulting Physicians: Dr. Claud Muirhead, Dr. J. O. Affleck, Dr. Andrew Smart, and Dr. Alexander James. Consulting Gynæcologists: Professor [illegible] J. Halliday Croom and Emeritus Professor Sir A. R. [illegible]pson. Consulting Physician for Diseases of the Skin: [illegible] W. Allan Jamieson. Professors of Clinical Medicine: [illegible] T. R. Fraser, Dr. W. S. Greenfield, and Dr. John Wyllie. Ordinary Physicians and Lecturers on Clinical Medicine: Dr. Byrom Bramwell, Dr. Geo. Gibson, Dr. Alex. Bruce, Dr. R. W. Philip, and Dr. W. Russell. Gynæcologists: Dr. A. H. F. Barbour and Mr. N. T. Brewis. Physician for Diseases of the Skin: Dr. Norman Walker. Assistant Physicians: Dr. G. Lovell Gulland, Dr. J. J. Graham Brown, Dr. Francis D. Boyd, Dr. R. A. Fleming, Dr. Harry Rainy, Dr. Chalmers Watson, Dr. Edwin Bramwell, and Dr. Edwin Matthew. Assistant Gynæcologists: Dr. J. Haig Ferguson and Dr. Wm. Fordyce. Assistant Physicians for Diseases of the Skin: Dr. Fred. Gardiner and Dr. R. Cranston Low. Medical Electrician: Dr. Dawson Turner. Assistant Medical Electrician: Dr. Hope Fowler. Medical Registrar: Dr. A. Dingwall Fordyce.

Surgical Department.—Consulting Surgeons: Mr. Joseph Bell, Mr. A. G. Miller, Dr. P. H. Maclaren, and Dr. C. W. MacGillivray. Consulting Ophthalmic Surgeon: Mr. George A. Berry. Consulting Aural Surgeons: Dr. P. McBride and Dr. McKenzie Johnston. Consulting Dental Surgeon: Dr. John Smith. Regius Professor of Clinical Surgery: Mr. F. M. Caird. Professor of Surgery: Mr. Alexis Thomson. Ordinary Surgeons: Mr. J. M. Cotterill, Mr. C. W. Cathcart, Mr. J. W. B. Hodsdon, and Mr. D. Wallace. Ophthalmic Surgeons: Dr. George Mackay and Dr. Wm. G. Sym. Surgeons to Ear and Throat Department: Dr. A. Logan Turner and Dr. J. Malcolm Farquharson. Dental Surgeons: Mr. William Guy and Mr. J. H. Gibbs. Assistant Surgeons: Mr. Alexander Miles, Mr. J. W. Dowden, Mr. A. A. Scot Skirving, Mr. Geo. L. Chiene, and Mr. W. J. Stuart. Assistant Ophthalmic Surgeons: Dr. J. V. Paterson and Dr. A. H. H. Sinclair. Assistant Surgeons to the Ear and Throat Department: Dr. John S. Fraser and Dr. John D. Lithgow. Pathologist: Dr. Theodore Shennan. Assistant Pathologists: Dr. W. T. Ritchie (Clinical Pathology), and Dr. Carnegie Dickson and Dr. J. D. Comrie (Morbid Anatomy). Surgical Registrar: Dr. Scott Carmichael. Superintendent: Colonel W. P. Warburton, I.M.S. (retired), M.D., C.S.I.

ROYAL HOSPITAL FOR SICK CHILDREN, Sciennes-road, Edinburgh.—This hospital contains 120 beds, and is fitted with every modern improvement. A fully equipped out-patient department (medical and surgical) is conducted daily in a building adjoining the hospital. Systematic courses of instruction, which qualify for graduation in the Edinburgh University and elsewhere, are given from time to time throughout the year by the staff. Students may enter at any time. Full particulars can be obtained from the Registrar at the hospital.

Staff.—Consulting Physician: Dr. J. Carmichael. Consulting Surgeon: Dr. J. Bell. Consulting Surgeon Dentist: Dr. J. Smith. Pathologist: (vacant). Ordinary Physicians: Dr. G. H. M. Dunlop, Dr. J. Thomson, and Dr.

---

* Lectures, £3 5s.; Practical, £3 3s.; Analytical, £2 a month, or £5 for three months. † Also in Summer Session. ‡ Also in Winter Session. § Practical, £3 3s.; Analytical, £2 a month, or £5 for three months.

N.B.—Where two or more lecturers appear as teaching the same subjects their lectures are not conjoined, but each gives an independent course.

J. S. Fowler. Surgeon: Mr. H. J. Stiles. Ophthalmic Surgeon: Mr. G. A. Berry. Assistant Surgeon: Mr. E. W. S. Carmichael. Medical Electrician: Dr. J. W. Spence. Extra Physicians: Dr. W. B Drummond, Dr. J. W. Simpson, and Dr. Dingwall Fordyce. Anæsthetists: Dr. D. C. A. M'Allum and Dr. J. Politachi.

EYE, EAR, AND THROAT INFIRMARY OF EDINBURGH, 6, Cambridge-street, Lothian-road.—Clinical Lectures and Instruction are given in this institution, which is open at 1 o'clock daily for outdoor patients for Eye Diseases; Mondays, Thursdays, and Saturdays at 12 noon, and Tuesdays and Fridays at 4 P.M. for out-door Ear, Nose, and Throat Patients. Special Practical Ophthalmoscopic Classes by arrangement. Patients whose diseases require operations or more than ordinary care are accommodated in the house. Consulting Surgeons: Dr. Joseph Bell, Dr. Logan Turner (Ear, Nose, and Throat Department). Surgeons: Dr. William George Sym, Dr. Malcolm Farquharson, Dr. J. V. Paterson, Dr. E. M. Lithgow, Dr. W. G. Porter. and Dr. John M. Darling. Honorary Anæsthetist: Mr. J. H. Gibbs. Dental Surgeon: Mr. G. W. Watson. Treasurer and Secretary: Mr. J. P. Watson, W.S., 32, Charlotte-square.

UNIVERSITY OF GLASGOW.

The University of Glasgow is both a teaching and a degree-granting body, but admits to graduation only candidates whose preliminary examination and course of study conform to its own regulations. Within certain limits instruction given by recognised medical schools and teachers may be accepted, but eight of the subjects other than clinical must be taken in this or some other recognised university entitled to confer the degree of M.D., and at least two years of the course must be taken in Glasgow University. Under the new regulations six degrees, open both to men and women, are conferred: M.B. and Ch.B. (always conjointly), M.D. and Ch.M.; B.Sc. in Public Health; D.Sc. in Public Health; and B.Sc. in Pharmacy. A Preliminary Examination must be passed in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek, or French, or German, with possible options to students whose native language is not English in the case of the fourth subject. Candidates taking the University preliminary examination are not obliged to pass in all the four subjects at one examination but must do so at not more than two occasions.

For the degrees of M.B. and Ch.B. a curriculum of five years is required, in each of the first four of which the student must attend at least two five months' courses, or alternately one five months' course and two courses of two and a half months. The minimum of attendance in the first four years includes five months' courses in the following subjects:—Anatomy, Practical Anatomy (two courses), Chemistry, Materia Medica and Therapeutics, Physiology, Practice of Medicine, Surgery, Midwifery and Diseases of Women and Infants, and Pathology; and courses of two and a half months in the following: Practical Chemistry, Physics, Botany, Zoology, Practical Physiology, Practical Pathology, Medical Jurisprudence, and Public Health. Candidates must attend at least three years the Medical and Surgical Practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons. At least nine months' hospital attendance is required on both Clinical Surgery and Clinical Medicine, and the student must have acted as clerk in medical and dresser in surgical wards, and must have had six months' outdoor practice; he must also have attended a course of Mental Diseases and of Practical Pharmacy (25 meetings), must have been properly instructed in Vaccination at a public vaccination station, and must have attended at least 12 cases of labour, or three months of the Practice of a Lying-in Hospital, six cases being personally conducted. The University also requires further study in Post-Mortem Examinations, Fevers, and Ophthalmology, and recommends study in other special subjects. If a candidate has completed in a University of the United Kingdom a course of study and passed an examination in Botany, Zoology, Physics, or Chemistry, qualifying for a degree in Science or in Arts, he is held to have passed the examinations in such subject or subjects.

There are four Professional Examinations, the first comprising Botany, Zoology, Physics, and Chemistry, to be taken after the completion of the included courses (candidates being at liberty to take two subjects at a time); the second comprising Anatomy, Physiology, and Materia Medica and Therapeutics, to be taken at the end of the third winter session; the third comprising Pathology, Medical Jurisprudence, and Public Health, to be taken at the end of the fourth winter session; and the fourth or final, comprising Surgery, Clinical Surgery, Practice of Medicine, Clinical Medicine, and Midwifery, to be taken on completion of the fifth year of study.

The degrees of M.D. (Doctor of Medicine) and Ch.M. (Master of Surgery) are higher degrees in Medicine and Surgery respectively, and candidates (not under 24 years of age) who have previously obtained the double bachelorship may be admitted to either M.D. or Ch.M. on completing the after course prescribed, including an examination in Clinical Medicine for M.D. and an examination in Surgical Anatomy, operations on the dead body, and Clinical Surgery for Ch.M.

Fees.—The Fees for M.B. and Ch.B. are £23 2*s*. The class fee in each subject of the curriculum for M.B. and Ch.B. is £2 2*s*., £3 3*s*., or £4 4*s*., and the present fees for hospital attendance are £10 10*s*. The fee for M.D. is £10 10*s*. (stamp duty being now abolished), and for Ch.M. £10 10*s*.

The great majority of the students take their hospital course at the Western Infirmary, where clinical instruction is given by professors of the University and others. Clinical instruction on Fevers is given at Ruchil and Belvidere Hospitals, while special courses, largely of a practical nature and embracing work in Hospital or Asylum wards, are conducted by University Lecturers on the Ear, the Throat and Nose, and Insanity. Queen Margaret College, hitherto conducted as a separate institution for the higher education of women, has now been made over to the University, and in it medical classes for women are conducted under University professors and other lecturers appointed by the University Court, whilst for clinical instruction female students are admitted to the Royal Infirmary.

Professors—Natural Philosophy: A. Gray, LL.D., F.R.S. Materia Medica: Ralph Stockman, M.D. Chemistry: John Fergusson, LL.D. Surgery: Sir William Macewen, M.D., F.R.S. Practice of Medicine: Sir Thomas McCall Anderson, M.D. Midwifery: Murdoch Cameron, M.D. Anatomy: John Cleland, M.D., F.R.S. Zoology: John G. Kerr, M.A. Botany: F. O. Bower, D.Sc., F.R.S. Physiology: D. Noel Paton, M.D. Forensic Medicine: John Glaister, M.D. Clinical Surgery: Sir H. C. Cameron, M.D. Clinical Medicine: S. Gemmell, M.D. Pathology: Robert Muir, M.A., M.D.

In this University Bursaries and Prizes to the annual amount of over £1000 are appropriated to students in the Medical Faculty, and there are, moreover, several Scholarships and Fellowships which may be held by medical students who have gone through the Arts course. The designation, money value, subjects of examination or other method of selection, conditions of eligibility, &c., of the Bursaries and Prizes are as follows:—Two Highland Society Bursaries, tenable for five years, open to medical students of Highland descent, £25 each, awarded on results of Preliminary Examination; Mackintosh Mental Science Bursary, open to medical students of either sex attending the Lectures on Insanity, £31; Monteith Bursary, tenable for two years, awarded on results of Second Professional Examination, £21, Anatomy and Physiology; Dr. Thomas Gibson Bursary, tenable for four years, open to medical students preparing to be Missionaries, £36, competition at the First Professional Examination; Coats Scholarship, open to graduates in medicine of not more than three years' standing, holder to prosecute research in pathology, £80, Pathology; John Macfarlane Bursary and Lorimer Bursary, each tenable for three years and open to medical students entering on their second winter session, £40 and £24 respectively; two Armagh Bursaries, open to students of either sex presenting themselves for the Final Examination for the degree of M.A. and intending to study Medicine, £48 each, one tenable for three years awarded for honours in Mental Philosophy, one tenable for two years awarded for honours in Classics; Taylor Bursary, tenable for four years, open to students of either sex in any Faculty, £7, appointment by the Senate; William Gardiner Bursary, tenable for two years, open to medical students of either sex, £14, Physiology, Chemistry, and Physics of Professional

Examinations; Rainy Bursary, tenable for two years, open to medical students entering on their fourth winter session, £20, Anatomy, Physiology, Chemistry, Botany, and Zoology; two Paterson Bursaries, tenable for four years, open to medical students of first or second session, £25 and £20 respectively, Mathematics and Dynamics; Brunton Memorial Prize, awarded annually to the most distinguished graduate in medicine of the year, £10; Dobbie Smith Gold Medal, awarded annually for an Essay on any Botanical subject; two Arnott Prizes, £20 and £15 respectively, Physiological Physics, &c.; Andrew and Bethia Stewart Bursary, tenable for three years, open to M.A. Graduates of the University, £50, Special Examination; Weir Bursary, awarded on result of Second and Third Professional Examinations, £16; McCunn Medical Research Scholarship, open to medical graduates of Scottish Universities, £100; (see University Calendar).

ANDERSON'S COLLEGE MEDICAL SCHOOL, Dumbarton-road, Glasgow, W.—This medical school was founded in the year 1800. It has given 13 professors to the University of Glasgow. The following courses are given, which qualify for all the licensing boards and for the Universities of London, Durham, Ireland, Edinburgh, and Glasgow (the latter two under certain conditions):—In winter: Anatomy, Professor A. M. Buchanan; Physics, Professor Peter Bennett; Chemistry, Professor J. Watson; Botany, Professor B. G. Cormack; Zoology, Professor Geo. Bell Todd; Materia Medica, Professor John P. Duncan; Midwifery, Professor John Edgar; Surgery, Professor G. H. Edington; Practice of Medicine, Professor John Cowan; Ophthalmic Medicine and Surgery, Dr. T. Spence Meighan; Aural Surgery, Dr. J. Galbraith Connal; Diseases of Throat and Nose, Dr. John Macintyre; Public Health (Laboratory Course), Professor Carstairs C. Douglas. In summer: Anatomy, Practical Anatomy, and Osteology; Practical Chemistry; Botany and Practical Botany; Zoology and Practical Zoology; Practical Physiology; Practical Materia Medica and Pharmacy; Medical Jurisprudence (Professor Carstairs C. Douglas); Diseases of Women and Children (Professor John Edgar); Operative Surgery; Ophthalmic Medicine and Surgery; Aural Surgery; Mental Diseases (Dr. John Carswell); and Public Health (Lecture Course and Laboratory Course). The Chemical Laboratory is open daily from 10 to 5. The Dissecting-room is open in winter from 9 A.M. to 6 P.M., and in summer from 6 A.M. to 6 P.M. The students are assisted in their dissections by the Professor and Demonstrators, by whom frequent examinations and demonstrations on the parts dissected are conducted. The supply of subjects for dissection is ample, and students are consequently provided with parts as soon as they may be ready for them. The Dissecting-room is provided with a complete series of dissected specimens, mounted in plaster of Paris, illustrating the anatomy of the human body. Candidates for the Licence in Dental Surgery can obtain the full medical curriculum in Anatomy, Chemistry, Physiology, Surgery, Practice of Medicine, and Materia Medica. The courses special to Dentistry are conducted at the Glasgow Dental Hospital and School.

The new buildings are situated in Dumbarton-road, immediately to the west of the entrance to the Western Infirmary, within two minutes' walk of it, and four minutes' walk of the University. Extensive accommodation is provided for Practical Anatomy, Practical Chemistry, Practical Botany, Practical Zoology, Practical Physiology, Practical Pharmacy, and Operative Surgery. Ample provision has also been made for the comfort of students.

Class Fees.—For each course of Lectures (Anatomy, Ophthalmic Medicine and Surgery, Aural Surgery, Diseases of Throat and Nose, Mental Diseases, and Public Health excepted), first session, £2 2*s*; second session (in Anderson's College), £1 1*s*. For Practical Classes (except Anatomy, Chemistry, and Public Health)—namely, Botany, Zoology, Physiology, Pharmacy, and Operative Surgery—first session, £2 2*s*.; second session, £2 2*s*. Anatomy Class Fees: Winter, first session, Lectures and Practical Anatomy, £5 5*s*.; Practical Anatomy alone, £2 2*s*. Second session, Lectures and Practical Anatomy, £5 5*s*.; Practical Anatomy alone, £2 2*s*. Third session, Practical Anatomy, £1 1*s*. Summer, Lectures and Practical Anatomy, £2 12*s*. 6*d*.; Lectures alone, £1 11*s*. 6*d*.; Practical Anatomy alone, £1 11*s* 6*d*.; Osteology and Practical [illegible]ogy alone, £1 11*s*. 6*d*.; Prac- [illegible] Chemistry: Lectures, £2 2*s*.; [illegible] Botany and Zoology: Reduced fees for Lectures with Laboratory work in Botany *or* in Zoology, during same summer session, £3 3*s*.; for Lecture Class or Practical Class separately, in Botany or in Zoology, £2 2*s*. Ophthalmic Medicine and Surgery (including Hospital Practice), Aural Surgery, Diseases of Throat and Nose, and Mental Diseases, fee for each course, £1 1*s*. Public Health Laboratory, fee for six months' course, £12 12*s*. Matriculation Fees: For the year, 10*s*.; for one class in winter session alone, 5*s*.; for summer session alone, 5*s*.

Western Infirmary.—Fees: For Hospital Attendance, £10 10*s*.; afterwards free. For Clinical Instruction, winter, £3 3*s*.; summer, £2 2*s*. Pathology: systematic, £4 4*s*.; practical, £3 3*s*. Vaccination fee, £1 1*s*.

Royal Infirmary.—Fees: Hospital Practice and Clinical Instruction, first year, £10 10*s*.; second year, £10 10*s*.; afterwards free. Six months, £6 6*s*.; three months, £4 4*s*. Pathology, both courses, £4 4*s*. Vaccination Fee, £1 1s.

Attendance at the dispensaries of the Western and Royal Infirmaries is included in the hospital fee.

Maternity and Women's Hospital.—Fee for six months, £3 3*s*.

Royal Hospital for Sick Children.—Fee for one year, £1 1*s*.

Eye Infirmary.—Fee: Hospital Practice and Clinical instruction, including Lectures at the College, six months, £1 1*s*.

Lock Hospital.—£1 1*s*.

Fever Hospital, Belvidere or Ruchill.—Fee, £1 1*s*.

Hospital for Skin Diseases.—Fee, £1 1*s*.

The Carnegie Trust extends its benefactions to students at Anderson's College Medical School. Full particulars may be obtained from Mr. W. S. McCormick, the Carnegie Trust Offices, Merchants' Hall, Edinburgh.

Certificates of attendance on the lectures at Anderson's College Medical School are received by the Universities of London, Durham, Ireland, Edinburgh, and Glasgow (the latter two under certain conditions); by the Royal Colleges of Physicians of London and Edinburgh; by the Royal Colleges of Surgeons, England, Edinburgh, and Ireland; by the Royal College of Physicians of Ireland; by the Faculty of Physicians and Surgeons of Glasgow; by the Society of Apothecaries, London; and by the Army, Navy, and East India Boards. The courses of Laboratory Instruction and Lectures in Public Health are recognised by the Scottish Colleges; by the Royal College of Physicians and the Royal College of Surgeons, Ireland; and by the University of Cambridge. Communications relating to the Medical School to be addressed to the Secretary of the Medical Faculty, Anderson's College Medical School, Glasgow, W. Communications relating to the Preliminary Examination in General Education to be addressed to Mr. Alexander Mackay, Educational Institute Office, 34, North Bridge-street, Edinburgh. Communications relating to the Triple Qualification to be addressed to Mr. Alexander Duncan, LL.D., Faculty Hall, 242, St. Vincent-street, Glasgow. Communications relating to the Dental School to be addressed to Mr. D. M. Alexander, 97, West Regent-street, Glasgow.

The Malcolm Kerr Bursary in Anatomy (value about £10) is open to students of the Junior Anatomy Class during Winter Session 1909–10.

The Wir [illegible], Oct. 11th, 1909, and [illegible] 1910.

The Su [illegible] Tuesday, April 19th, 1910, and will be closed on Tuesday, June 28th, 1910.

ST. MUNGO'S COLLEGE AND GLASGOW ROYAL INFIRMARY.—This College was incorporated in 1889. The Glasgow Royal Infirmary was founded in 1791. The Faculty of Medicine of the College occupies new buildings erected for the purposes of a medical school, adjoining and communicating with the Royal Infirmary. The Laboratories, Museums, and Lecture-rooms are equipped and adapted to modern scientific requirements. Recent additions consist of Public Health, Practical Zoology, and Bacteriological Laboratories. A complete electric light installation has been added and a powerful Educational Lantern has been provided for demonstration purposes. The Royal Infirmary, which is at the service of the

College for the purpose of clinical and practical instruction, is one of the largest hospitals in the kingdom. The winter session will open on Monday, Oct. 11th.

Psychological Medicine.—Practical instruction is given in Woodilee Asylum, situated within a short distance of Glasgow and having accommodation for 850 patients. Six resident clinical clerks are appointed annually. These clerkships are open to students attending St. Mungo's College.

Clinical Instruction in Fevers.—Classes are conducted by Dr. Johnston, Superintendent, at the City of Glasgow Fever Hospital, Belvidere; and Dr. Brownlee, Superintendent, at the City of Glasgow Fever Hospital, Ruchill.

Clinical Instruction in Midwifery.—The close proximity of the Maternity Hospital enables the Professor of Midwifery to conduct frequent clinical demonstrations there during the summer session.

The classes in St. Mungo's College qualify for the English, Scotch, and Irish Conjoint Boards and, under certain conditions, for the various universities, including the University of London. Students who have fulfilled the conditions of the Carnegie Trust as regards Scottish birth or extraction, age (16 years), and Preliminary Examination, are eligible for the benefits of this Trust during the whole course of their studies at St. Mungo's College.

The fee for each class is £2 2*s.*, except Zoology and Botany, joint fee £3 3*s.*, Anatomy, Winter Session, £4 4*s.*; Pathology, £4 4*s.*, Physics, £2 4*s.* 6*d.*, Public Health Laboratory, £12 12*s.*, and certain extra classes for which the fee is £1 1*s.* The hospital fee (including clinical lectures) is £21 for a perpetual ticket.

The classes in St. Mungo's College are now open to male and female students equally.

The minimum fees for all the lectures, including hospital attendance, necessary for candidates for the Diplomas of the English or Scotch Colleges of Physicians and Surgeons amount to £65. Further particulars can be obtained from a syllabus which may be procured free on application to the Dean, 86, Castle-street, Glasgow.

GLASGOW WESTERN MEDICAL SCHOOL.—This School is situated in University-avenue, close to the University and Western Infirmary. Lectures and Demonstrations are given on Chemistry, on Anatomy, on Surgery, on Midwifery and Gynæcology, on Medicine, and on the Eye. Some of the classes qualify for graduation and for Scotch diplomas.

Class Fees.—For each course of Lectures the fee is £2 2*s.*, or in some cases £1 1*s.* There is no matriculation fee.

Lecturers: Winter Session.—Chemistry: Dr. Neave; Anatomy: Dr. Wright Thomson, Tuesday, Wednesday, and Friday, at 4.15 P.M.; Surgery: Dr. A. Young, at 12 noon; Midwifery: Dr. Balfour Marshall, at 2 P.M.; Medicine: Dr. A. B. Sloan, at 3 P.M.; The Eye: Dr. Fergus, Monday and Thursday, at 4 P.M.

Summer Session.—Chemistry: Dr. Neave; Anatomy: Dr. Wright Thomson, Tuesday and Friday, at 3.15 P.M.; Operative Surgery: Dr. A. Young, Monday, Wednesday, and Friday, at 1 P.M.; Gynæcology: Dr. Balfour Marshall, at 2 P.M.; Medicine: Dr. A. B. Sloan, Monday, Tuesday, and Friday, at 4 P.M.; Ophthalmology: Dr. Fergus, Monday and Thursday, at 11 A.M. and 3 P.M. Some of the above hours are liable to alteration. Further particulars can be obtained from the Secretary, Mr. J. N. Morton, 58, Bath-street.

QUEEN MARGARET COLLEGE, University of Glasgow.—Queen Margaret College was founded in 1883 by the Glasgow Association for the Higher Education of Women (instituted in 1877), and handsome buildings and grounds near the University were presented to the College in 1884 by Mrs. John Elder. In 1890 a School of Medicine for women was added to its Arts Faculty. In 1892, when the Universities Commissioners issued an ordinance empowering the Scottish University Courts to make provision for the instruction of women, the Council of the College and Mrs. Elder transferred to the University the College, its buildings, grounds, and endowments, on condition that these should be devoted to the maintenance of University classes for women only. The College then became the women's department of the University of Glasgow; its classes are taught by professors of the University and other lecturers appointed by the University Court, and it is governed by the University Court and Senate. The curriculum, regulations, and fees are the same as those of the male students, and the University degrees are open to women on the same conditions as to men. They have access to the University Museum and can borrow books from the University Library, besides having a library of reference in Queen Margaret College. The number of students enrolled in session 1908-1909 was 676, of whom about 80 were studying medicine and the rest arts or science. The School of Medicine is a special feature of the College, and gives full preparation for the medical degrees of the University. In July, 1894, for the first time in the history of any Scottish university, women students graduated in medicine at the "capping" in Glasgow University. 141 women have now taken the degree of M.B., C.M., or M.B., Ch.B. of the University of Glasgow. The women students work in the University laboratories for Physics, Zoology, Botany, Physiology, Pathology, Medical Jurisprudence, and Public Health, and have special laboratories for Chemistry and Anatomy at Queen Margaret College. Excellent facilities for clinical work are given in the Royal Infirmary, in the New Maternity, and other hospitals. By a gift of £5000 granted for the purpose by the Bellahouston Trust the University Court was enabled to add to the College a large building for the study of Anatomy and other medical subjects which was opened in October, 1895. The Arthur Scholarship is open every third year to students of first year; other Bursaries are open in Arts and Medicine; and by an ordinance of the Universities Commissioners women are admitted to certain University bursaries, scholarships, and fellowships. A house of residence for the students of the College coming from a distance was opened by the Queen Margaret Hall Co., Limited, in October of 1894. The Winter Session commences on Oct. 11th.

Lecturers (other than University Professors).—Anatomy: Dr. T. H. Bryce. Chemistry: Dr. H. W. Bolam. Medicine: Dr. W. K. Hunter. Surgery: Mr. J. H. Pringle. On the Eye: Dr. A. M. Ramsay.

ROYAL INFIRMARY, Glasgow.—This infirmary, which is the largest in Glasgow, is situated in Cathedral-square, Castle-street, and has car communication with every part of the city. St. Mungo's College is in the infirmary grounds. The infirmary has, including the Ophthalmic Department, over 620 beds, the average number occupied in 1908 being 625. When the rebuilding of the infirmary, now in progress, is completed it will have about 700 beds. There are special beds and wards for diseases of women, of the throat, nose, and ear, venereal diseases, burns, and septic cases. Wards are set apart for the teaching of Women Students. At the Out-door Department the attendances in 1908 numbered over 140,000. In addition to the large medical and surgical departments there are departments for special diseases—viz., diseases of women, of the throat and nose, of the ear, of the eye, of the skin, and of the teeth. Five house physicians and nine house surgeons, having a legal qualification in medicine and surgery, who board in the hospital free of charge, are appointed every six months. Clerks and dressers are appointed by the physicians and surgeons. As a large number of cases of acute diseases and accidents of a varied character are received these appointments are very valuable and desirable. There is a modern and fully equipped Electrical Pavilion and year by year the latest and most approved apparatus for diagnosis and treatment has been added. The fees for hospital attendance, including clinical lectures and tutorial instruction, attendance at the out-door department, at the pathological department, post-mortem examinations, and the use of the museum are as follows: For one year, £10 10*s.*; for six months, £6 6*s.*; for three months, £4 4*s.* Students who have paid fees to the amount of £21 to the Glasgow Royal Infirmary shall be permitted to attend in any subsequent year or years one winter and one summer course of instruction in the infirmary without further payment; and students who have paid to any other hospital in the United Kingdom fees, being not less than £21, in virtue of which they are entitled to attend without further payment, shall be admitted as students of the Royal Infirmary on payment of £3 3*s.* for six months or £1 11*s.* 6*d.* for three months.

Staff.—Visiting Physicians: Dr. G. S. Middleton, Dr. T. K. Monro, Dr. W. K. Hunter, Dr. J. M. Cowan, and Dr. J. B. Mackenzie Anderson. Visiting Surgeons: Mr. John Barlow, Mr. J. A. Adams, Mr. David Newman, Mr. Q. McLennan, Mr. J. H. Pringle, Mr. H. Rutherfurd, and Mr. P. Paterson. Consulting Surgeon for Diseases of the Eye: Dr. A. Maitland Ramsay. Surgeon for Diseases of the

Throat and Nose and Consulting Medical Electrician: Mr. J. Macintyre. [illegible] for Diseases [illegible] and Curator [illegible] Pathologist: [illegible] McCrorie. Assistant Bacteriologists: Mr. J. A. Campbell and Dr. Lizzie T. Fraser. Medical Electrician: Mr. J. R. Riddell. Assistant Medical Electricians: Dr. Samuel Capie, Dr. Katharine M. Chapman, and Dr. Janie S. McLachlan. Anæsthetists: Dr. John Donald and Dr. R. Bruce. Vaccinator: Dr. H. H. Borland. Dispensary Physicians: Mr. David McCrorie, Dr. John Henderson, Dr. Campbell S. Marshall, Dr. James Scott, Dr. J. T. McLachlan, and Dr. A. W. Harrington. Extra Dispensary Physicians: Dr. Dugald McPhail, and Dr. Wm. H. Brown. Dispensary Surgeons: Mr. A. N. McGregor, Mr. John Patrick, Mr. John A. C. Macewen, Mr. A. C. Faulds, Mr. Thomas Kay, and Mr. Robert Ramsey. Extra Dispensary Surgeons: Mr. James Battersby, Mr. Donald Duff, and Mr. Spencer Mort. Dispensary Specialists:—*Diseases of Women*: Dr. Peter McBryde, Dr. W. D. Macfarlane, jun., Dr. A. G. Banks, and Dr. Margaret H. Smart; Diseases of the Ear: Dr. James Adam; Diseases of the Skin: Dr. Alexander Morton and Dr. G. McIntyre; Diseases of the Throat and Nose: Dr. R. Fullerton and Dr. Grant; Diseases of the Eye: Dr. J. Rowan, Dr. H. W. Thomson, and Dr. J. H. McIlroy; Diseases of the Teeth: Mr. W. Taylor and Mr. W. R. Taylor. Superintendent: Dr. J. Maxtone Thom.

GLASGOW WESTERN INFIRMARY.—This hospital adjoins the *University of Glasgow*. Number of beds upwards of 520. Special wards are set apart for Diseases of Women and for Affections of the Skin. In the out-patient department there are special cliniques for Diseases of Women and for Diseases of the Throat, Ear, and Tooth. The Clinical Courses are given by the physicians and surgeons, each of whom conducts a separate class, and students require to enter their names at the beginning of the session for the class which they propose to attend. Special instruction is given to junior students by tutors or assistants, and clinical clerks and dressers are selected from the members of the class. All the courses of clinical instruction are recognised by the University of Glasgow and the [illegible] annually, without salary, from those who have completed their course. The fee for hospital attendance is £10 10*s*. and the fees for clinical instruction are £3 3*s*. for the Winter Session and £2 2*s*. for the Summer Session.

Staff.—Honorary Consulting Physician: Dr. G. P. Tennant. Honorary Consulting Gynæcologist: Dr. W. L. Reid. Visiting Physicians: Dr. Samson Gemmell, Dr. Ralph Stockman, and Dr. Wm. MacLennan. Visiting Surgeons: Sir Hector C. Cameron, Sir W. Macewen, Dr. J. C. Renton, Sir George T. Beatson, K.C.B., Dr. T. K. Dalziel, and Dr. James H. Nicoll. [illegible] of Women: Dr. Murdoch Cameron [illegible] Assistant Physicians: Dr. R [illegible] Dr. James Carslaw, and Dr. John S M'Kendrick. Assistant Surgeons: Dr. Duncan Macartney, Dr. Robert Kennedy, Dr. Alfred A. Young, Dr. G. B. Buchanan, Dr. John Morton, and Dr. G. H. Edington. Dispensary Physicians: Dr. Robert Fullarton, Dr. John Gracie, Dr. J. Campbell McClure, Dr. Frank Charteris, Dr. A. B. Sloan, and Dr. Leonard Findlay. Dispensary Surgeons: Dr. Farquhar Macrae, Dr. Alex. MacLennan, Dr. Archd. Young, Dr. M. L. Taylor, Dr. W. W. Christie, and Dr. C. C. Cuthbert. Anæsthetists: Dr. James P. Boyd, Dr. Home Henderson, Dr. Dingwall Kennedy, Dr. John W. Renton, and Dr. J. K. Patrick Dispensary Gynæcologists: Dr. S. Cameron and Dr David Dickie. Extra Dispensary Physicians: Dr. John P. Duncan, Dr. Murray Ross Taylor, Dr. Geo. A. Allan, Dr. Jas. R. C. Greenlees, Dr. G. H. Clark, and Dr. D. R. Kilpatrick. Extra Dispensary Surgeons: Dr. A. H. Edwards, Dr. R. B. Carslaw, Dr Wm. Rankin, and Dr. J. Mill Renton. Extra [illegible] for Diseases of the Ear: Dr. Thomas [illegible] y Surgeon for Disease [illegible] Honorary Consulting O[illegible] Dispensary Surgeon fo[illegible] Dr. J. Walker Downie. [illegible] Consulting Physician for Mental Disorders: Dr. L. R. Oswald. Consulting Medical Electrician: Dr. D. J. [illegible] V.O. Medical Electricians: Dr. J. G. [illegible] Archd. Hay, and Dr. W. F. Somerville. [illegible] Robert Muir. Assistant Pathologists: [illegible] nd Dr. Leonard Findlay. Vaccinator: Dr. J. W. Nicol. Dental Surgeon: Mr. W. D. Woodburn, L.D.S. Superintendent: Dr. Donald J. Mackintosh, M.V.O. Matron: Miss H. Gregory Smith. Secretary and Treasurer: Henry Johnston, 87, Union-street. Assistant Secretary: J. Matheson Johnston, C.A.

ROYAL HOSPITAL FOR SICK CHILDREN, Glasgow.—The Hospital at Garnethill was opened in December, 1882, and in June, 1903, a country branch consisting of two wards was opened at Drumchapel. The number of beds in the town hospital and country branch together is 100. A specially designed Dispensary, or Out-patient Department, was opened in October, 1888, in West Graham-street. A central site close to the University has been secured and a hospital of at least 200 beds to take the place of the one in Garnethill will be erected thereon shortly. The whole institution is for non-infectious cases and is available to medical students for clinical instruction in the diseases peculiar to childhood. Classes are formed both at Hospital and Dispensary at the beginning of the University session in October. Students may be enrolled at any time. Fee £1 1*s*. per annum, admitting to both Hospital and Dispensary. Further particulars on applying to the House Surgeon, 45, Scott-street, Garnethill, Glasgow. Physicians: Dr. Samson Gemmell and Dr. George S. Middleton. Surgeons: Mr. T. Kennedy Dalziel and Mr. R. H. Parry.

GLASGOW OPHTHALMIC INSTITUTION, 126, West Regent-street (29 beds and six cots).—Clinical and systematic course of lectures for students during the winter and summer sessions. In-patients, 1053; out- or dispensary patients, 10,306. Operations on [illegible] Honorary Consulting Surgeon: [illegible] Dr. A. Maitland Ramsay. As[illegible] Rowan, Dr. H. Wright Thoms[illegible] Pathologist: Dr. Mary Hannay. Bacteriologist: Dr. J. Campbell McClure. Electrician: Dr. John Gilchrist. Anæsthetist: Dr. R. H. Henderson. House Surgeon: Dr. John Fotheringham. This institution is the Ophthalmic Department of the Royal Infirmary. A post-graduate course is given by Dr. Ramsay and assistants during September. Clinical instruction is given in the summer session to students of the *University and Queen Margaret College* and in winter to students of St. Mungo's College and to all who take the class.

GLASGOW EYE INFIRMARY, Berkeley-street and Charlotte-street.—This institution, the largest of its kind in Scotland, was founded in 1824. The Infirmary now consists of two large buildings—that in Berkeley-street being occupied as the Infirmary proper, and that in Charlotte-street (new buildings opened June, 1894) as a dispensary. The Infirmary is devoted exclusively to the treatment of Diseases of the Eye, and is intended primarily to provide treatment, and, when necessary, board and lodging, for those who are unable to do so for themselves. The average number of new patients for the last ten years has been 22,291·3, and the total number of cases in 1908 was 25,570.

Gentlemen may attend as students on payment to the treasurer of the following fees:—For six months £1 1*s*., 12 months £2 2*s*. All students when duly entered in the Infirmary Register may attend the clinical instruction of any or every member of the medical staff on production of their tickets. The days on which the surgeons respectively attend to receive patients may be ascertained at the Infirmary. Students have the privilege of being present in the Dispensaries at such hours as are arranged. They may enter the wards along with the surgeon whose clinique they are attending when he visits his patients. They may also be present at operations under the sanction of the surgeon operating, but no student may enter the wards or operating-room except under the aforesaid regulation. Students may be allowed the use of the journals and case-books for examination on applying to the House Surgeon. The wards and dispensary are recognised by the University of Glasgow for the purpose of instruction in [illegible] for graduation in medicine. Secretary and [illegible] Harold John Black, 88, West Regent-[illegible] The medical session opens in October. [illegible] taff is as follows:—Surgeons: Dr. Thomas S. Meighan, Dr. A. Freeland Fergus, Dr.

Andrew Wilson, Dr. James Hinshelwood, Dr. Leslie Buchanan, and Dr. W. Ernest F. Thomson. Assistant Surgeons: Dr. A. Lewis M'Millan, Dr. Henry L. G. Leask, Dr. W. Cochrane Murray, Dr. Brownlow Riddell, Dr. Arthur J. Ballantyne, and Dr. Arthur Vost. Pathologist: Dr. M. Logan Taylor. House Surgeon: Dr. Jas. D. Kidd. Assistant House Surgeon: Dr. Wm. H. Manson.

UNIVERSITY OF ST. ANDREWS (UNITED COLLEGE, ST. ANDREWS AND UNIVERSITY COLLEGE, DUNDEE).

The following are extracts from the Regulations for Degrees in Medicine contained in Ordinance No. 45 (St. Andrews, No. 4) of the Commissioners under the Universities (Scotland) Act, 1889. These regulations came into force on April 19th, 1897. Four degrees in Medicine and Surgery shall be conferred by the University of St. Andrews—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), and a Diploma in Public Health. The whole curriculum may be taken at University College, Dundee, or the first two years of the course may be taken at St. Andrews and the remaining three years in Dundee. The degrees of M.B. and Ch.B. shall always be conjoined. Before commencing his medical studies each student shall pass a Preliminary Examination in (*a*) English, (*b*) Latin, (*c*) Elementary Mathematics, and (*d*) one of the following optional subjects:—(α) Greek, (β) French, (γ) German, (δ) Italian, (ε) any other Modern Language, (ϛ) Logic. A degree in Arts or in Science in any of the Universities of the United Kingdom and in some colonial or foreign universities shall exempt from the Preliminary Examination. The Preliminary Examination for graduation in Medicine and Surgery, Arts or Science, of the University of St. Andrews is accepted as equivalent to the Registration Examination required by the General Medical Council (the certificate to include the required subjects). Also the Final Examination for a degree in Arts or Science and the Final Examination for the Diploma of L.L.A.

Degree of Bachelor of Medicine and Bachelor of Surgery.—Candidates must have been engaged in medical study for at least five years. In each of the first four years the candidate must have attended at least two courses of instruction in one or more of the subjects of study specified below, each course extending over a session of not less than five months, either continuous or divided into two terms, or, alternatively, one such course along with two courses, each extending over a session of not less than two and a half months. During the fifth or final year the candidate shall be engaged in clinical study for at least nine months at the Infirmary of Dundee or at one or more of such public hospitals or dispensaries, British or foreign, as may be recognised for the purpose by the University Court. The candidate must have received instruction in each of the following subjects of study, including such examinations as may be prescribed in the various classes—viz.: Anatomy, Practical Anatomy, Chemistry, Materia Medica, Physiology, or Institutes of Medicine, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Infants, Pathology, Practical Chemistry, Physics (including the Dynamics of Solids, Liquids, and Gases, and the Rudiments of Sound, Heat, Light, and Electricity), Elementary Botany, Elementary Zoology, Practical Physiology, Practical Pathology, Forensic Medicine, and Public Health. The candidate must have attended for at least three years the Medical and Surgical Practice either of the Infirmary of Dundee or of a General Hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons and is recognised for the purpose by the University Court. Additional subjects of study are Practical Pharmacy, Mental Diseases, Practical Midwifery, Operative Surgery, Vaccination, Children's Diseases, Fevers, Ophthalmology, and Post-mortem Examinations.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations shall have effect:—1. Two of the five years of medical study must be spent in the University of St. Andrews. 2. The remaining three years may be spent in any University of the United Kingdom or in any Indian, Colonial, or Foreign University recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court.

Women shall be admitted to graduation in Medicine, subject to the provisions of Ordinance No. 18 [General No. 9—Regulations for the Graduation of Women and for their Instruction in the Universities]: Provided always that every candidate for graduation shall produce evidence of having satisfied the conditions herein laid down with respect to the Preliminary Examination, and shall be examined in all the subjects necessary for graduation by the Examiners of the University of St. Andrews. All the classes necessary for graduation shall be taken in the University of St. Andrews, except in so far as instruction obtained elsewhere is allowed by the said Ordinance.

Professional Examinations for the Degrees of Bachelor of Medicine and Bachelor of Surgery.—Each candidate shall be examined both in writing and orally, and also clinically where the nature of the subject admits, in the following divisions—viz., first, in Botany, Zoology, Physics, and Chemistry; second, in Anatomy, Physiology, and Materia Medica; third, in Pathology, and Forensic Medicine and Public Health; and fourth, in Surgery, Clinical and Operative Surgery, Practice of Medicine and Clinical Medicine, and Midwifery and Gynæcology (Systematic and Clinical).

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery shall be 22 guineas and the proportion of this sum to be paid by a candidate at each division of the examination shall be regulated from time to time by the University Court. The fee to be paid for the degree of Doctor of Medicine shall be 10 guineas, exclusive of any stamp duty which for the time may be demanded. The fee to be paid for the degree of Master of Surgery shall be 10 guineas.

The whole medical curriculum can be taken in University College or the first two years in United College.

Bursaries, United College, St. Andrews.—Fourteen Taylour Thomson Bursaries for female Medical students of the annual value of from £20 to £30 each, tenable for one or two years. The Bursaries are awarded in the order of merit, the most valuable ones being given to those students who obtain the highest marks in the Preliminary Examination and who are prepared to take two Anni Medici at the United College, St. Andrews.

University College, Dundee.—(*a*) Open to either sex. Eleven Entrance Bursaries of £15, tenable for one year. (*b*) Open to either sex: Four £20 and three £15, second year. (*c*) Four £20 and two £15, third year. (*d*) Two £20, fourth year. (*e*) Two £20, fifth year. (*f*) Bute Bursary, founded in 1893 by the late Most Honourable the Marquis of Bute, K.T. This Bursary consists of the free proceeds of £1000. (*g*) Two Bursaries of the annual value of £25, tenable for three years at either University College, Dundee, or at any Scottish University (local candidates only).

Professors—Natural Philosophy: William Peddie, D.Sc., F.R.S.E. Chemistry: Hugh Marshall, D.Sc., F.R.S. Edin. Natural History: D'Arcy W. Thompson, M.A., C.B. Botany: Patrick Geddes, F.R.S.E. Anatomy: J. Yule Mackay, M.D., LL.D Physiology: E. W. Reid, B.A., D.Sc., M.B., M.R.C.S., F.R.S. Pathology: L. R. Sutherland, M.B., C.M. Surgery: D. MacEwan, M.D. Medicine: Alexander M. Stalker, M.A., M.D. Midwifery: J. A. C. Kynoch, M.B., F.R.C.P. Edin. Materia Medica: C. R. Marshall, M.A., M.D.

United College of St. Salvator and St. Leonard.—Professors—Natural Philosophy: A. S. Butler, M.A. Natural History: W. C. MacIntosh, M.D., LL.D., F.R.S. Chemistry: James C. Irvine, D.Sc., Ph.D. Anatomy: James Musgrove, M.D., C.M. Physiology: Percy T. Herring, M.D.

For further particulars apply to Professor Kynoch, Dean of the Medical Faculty, University College, Dundee.

University College, Dundee.—This College is one of the constituent colleges of the University of St. Andrews. In the new medical buildings there are spacious and well-equipped laboratories and work-rooms for Anatomy, Physiology, Materia Medica, Pathology, Ophthalmology, Public Health, Medicine, Surgery, and Gynæcology. The complete medical curriculum can be taken in Dundee. For classes, fees, &c., see under University of St. Andrews.

Royal Infirmary, Dundee.—The Infirmary contains 400 beds, including special wards for the Diseases of Women, Children, Eye, Ear and Throat, Skin, and Obstetric cases.

There is in addition an Extern Obstetric Department. There were during last year 20,543 out-patients and 7281 home patients. The *Royal Infirmary* [illegible] practical work to students. [illegible] Resident Medical Assistants [illegible] and one non-resident Obstetric Assistant. Clinical Clerks and Dressers are attached to the Physicians and Surgeons, and students are appointed as assistants in the Pathological Department. There are in connexion with the clinical courses Tutorial Classes in Medicine and Surgery. Instruction is also given in Practical Pharmacy and Materia Medica and in Practical Dentistry. Further information can be obtained from Dr. Fraser, Medical Superintendent.

ROYAL and DISTRICT ASYLUMS, Dundee (five miles from City). Number of patients, 490.—Physician Superintendent: Dr. William Tuach-Mackenzie. Lectures on Mental Diseases and clinical instruction in connexion with University College, Dundee (University of St. Andrews), are given during the Summer Session at University College and at the Royal and District Asylums by Dr. Tuach-Mackenzie. The course consists of 12 Lectures and 14 Clinical Lectures and Demonstrations. There are two paid qualified Resident Assistants and two unpaid Resident Clinical Assistants.

UNIVERSITY OF ABERDEEN.

The Univer[illegible] degrees in Medicine and Sur[illegible] M.D.), Master of Surgery [illegible] (M.B.), and Bachelor of S[illegible]s of M.B. and Ch.B. are not conferred separately and the higher degrees of M.D. and Ch.M. *are only granted to holders of the M.B. and* Ch.B. degrees.

Degrees of M.B. and Ch.B.—Before commencing his medical studies each student must pass a Preliminary Examination in (1) English, (2) Latin, (3) Mathematics, and (4) Greek, or French, or German. In the case of a candidate whose native language is not English an examination in the [illegible] in Fre[illegible] classic[illegible] culum for the degrees extend over a period of five years, during which attendance is required in the following subjects: Botany, Zoology, Physics, Chemistry (Systematic and Practical), Anatomy (Systematic and Practical), Physiology (Systematic and Practical), Materia Medica and Therapeutics, Practical Pharmacy, Pathology (Systematic and Practical), Medical Jurisprudence and Public Health, Surgery, Medicine, and Midwifery.

Candidates must attend for at least three years the medical and surgical practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons, and they must have attended courses of at least nine months in clinical medicine and clinical surgery. The candidate must have acted as clerk in the medical and dresser in the surgical wards of a hospital and must have attended for at least six months the practice of a dispensary or the out-practice of a hospital, &c. Attendance is also required on courses in Mental Diseases, Fevers, Ophthalmology, Post-mortem Examinations, and other special subjects. The candidate is also required to have been properly instructed in Vaccination and to have attended at least 12 Midwifery cases.

Professional Examinations are held twice in each year—namely, in March and July, directly after the close of the winter and summer sessions.

The fee for the degrees of M.B. and Ch.B. amounts to £23 2*s*. Matriculation fee for the winter and summer sessions, £1 1*s*.; summer session alone, 10*s*. 6*d*.

Besides the Royal Infirmary, students have the opportunity of attending the following institutions: City Fever Hospital, Sick Children's Hospital, General Dispensary, and Lying-in and Vaccine Institutions (daily), Royal Lunatic Asylum, Ophthalmic Institution, &c.

Degrees of M.D. and Ch.M.—Candidates for either of these degrees must already hold the degrees of M.B. and Ch.B. of Aberdeen. A thesis has to be presented for approval by the Medical Faculty and an examination has to be passed in Clinical Medicine or Clinical Surgery as the case may be. Fee for each of the degrees £10 10*s*.

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom, after a special examination. The diploma can be entered on the Register of the General Medical Council.

Application for further information should be addressed to the Secretary of the Medical Faculty.

Professors—Natural Philosophy: C. Niven, M.A., F.R.S. Physiology: J. A. MacWilliam, M.D. Medicine: David White Finlay, M.D. Chemistry: F. R. Japp, LL.D., F.R.S. Anatomy: R. W. Reid, M.D., F.R.C.S. Surgery: (vacant). Materia Medica: J. T. Cash, M.D., F.R.S. Midwifery: W. Stephenson, M.D. Forensic Medicine: Matthew Hay, M.D. Botany: J. W. H. Trail, M.D., F.R.S. Pathology: Geo. Dean, M.B. Natural History: J. Arthur Thomson, M.A.

Scholarships and Prizes.—In the Faculty of Medicine of the University of Aberdeen there are the following Bursaries, Scholarships, and Prizes:—Bursaries: about 15 Bursaries (competition and presentation) are open each year, of £15 to £20 per annum in value, most of them being tenable for three years; certain other Bursaries are not confined to the Faculty of Medicine, but may be held by Arts Students. Scholarships: five Post-Graduate Scholarships, value £36 to £160 per annum. Prizes and Medals: 13 Gold Medals and Prizes for proficiency in special departments, &c.

Clinical Instruction.—ABERDEEN ROYAL INFIRMARY.—Contains 251 beds. Consulting Physician: Dr. Angus Fraser. Physicians: Professor Finlay, Dr. George M. Edmond, and Dr. Ashley W. Mackintosh. Assistant Physicians: Dr. A. H. Lister, Dr. W. R. Pirie, and Dr. Thos. Fraser. C[illegible] [illegible]xander Ogston, Dr. J. C. [illegible] h. Surgeons: Mr. J. S. [illegible] Mr. H. M. W. Gray. A[illegible] Milne, Dr. Henry Pe[illegible] Ophthalmic Surgeon: Dr. C. H Usher. Assistant Ophthalmic Surgeon: Dr. W. Clark Souter. Gynæcologist: Professor W. Stephenson. Pathologist: Professor George Dean. Assistant Pathologist: Dr. G. M. Duncan. Dental Surgeon: Dr. J. M. P. Crombie. *Anæsthetist: Dr. J. J. Y. Dalgarno.* Assistant Anæsthetists: Dr. Alex. Mitchell and Dr. A. W. Falconer. Medical Electrician: Dr. J. R. Levack. Assistant Medical Electrician: Dr. Clifford T. Bell. Dermatologist and Lecturer on Diseases of the Skin: Dr. J. F. Christie. [illegible]cal Registrar: Dr. William [illegible] nd Factor for the Hospital [illegible] Union-street, Aberdeen.

ABERDEEN ROYAL LUNATIC ASYLUM.—*Contains*, with hospital attached to main institution and agricultural branch, about 986 beds. Medical Superintendent: Dr. William Reid. Assistant Physicians: Dr. Arthur Kellas, Dr. Kenneth Ross, and Dr. James Laing. Clerk, Treasurer, and Factor: Mr. A. Scott Finnie, 343, Union-street, Aberdeen. Clinical instruction is given to students during three months in summer.

SCOTTISH MEDICAL CORPORATIONS GRANTING DIPLOMAS.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH, ROYAL COLLEGE OF SURGEONS OF EDINBURGH, AND FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

These Colle[illegible] by which, after one series of [illegible] or Glasgow, or both, the s[illegible] of the three Bodies.

The three Bodies grant their Single Licences only to candidates who already possess [illegible] cine or Surgery. Copies of the [illegible] Licence of any of the Bodies [illegible] to the respective secretaries.

Professional Education—I. The candidate must produce certificates or other satisfactory evidence of having attended the following separate and distinct courses of [illegible] Physics, three months; Elementary Biology, [illegible] months; Practical or [illegible]; Anatomy, during at [illegible], twelve months; Physi[illegible]dica, three months; [illegible]hology), six months; [illegible] Practice of Medicine, six months; Clinical Medicine, nine months; Principles and Practice of Surgery, six months; Clinical Surgery, nine months; Midwifery and the Diseases of Women and Children, three months; Medical

Jurisprudence and Public Health, three months. The number of lectures certified as attended at any school not situated in Scotland should not be less than three-fourths of the total number of lectures delivered in a course. II. The candidate must also produce the following certificates :—(*a*) Of having personally attended not less than six cases of labour, or alternatively attendance on 12 cases of labour, at least five of these to be conducted personally under the direct superintendence of the practitioner who signs the certificate, who must be a registered medical practitioner, but the practical midwifery applicable to students commencing medical study on and after Oct. 1st, 1908, is as follows: 1. Every student before commencing the study of Practical Midwifery shall have attended a course of lectures on Surgery and Midwifery and be required to have held the offices of Clinical Medical Clerk and Surgical Dresser. 2. Every student shall be required either—(1) to have attended the indoor practice of a lying-in hospital or the lying-in wards of a general hospital for a period of three months to the satisfaction of the medical officer in charge, and after having received therein practical instruction in the conduct of labour, under the personal supervision of a medical officer, to have conducted 12 cases of labour under official medical supervision; or (2) to have conducted not less than 12 cases of labour, subject to the following conditions—That he has during one month given regular daily attendance upon the indoor practice of a lying-in hospital or the lying-in wards of a general hospital or Poor-law infirmary recognised for that purpose by any of the licensing bodies, and that he has therein conducted cases of labour under the personal supervision of a medical officer of the hospital or infirmary, who shall, when satisfied of the student's competence, authorise him to conduct outdoor cases under official medical supervision. 3. No certificate that the student has conducted the above-mentioned 12 cases of labour shall be accepted unless it is given by a member of the staff of a lying-in hospital or of the maternity charity of a general hospital or of a dispensary having an obstetric staff recognised for that purpose by any of the licensing bodies or of a Poor-law infirmary having a resident medical officer so recognised. (*b*) Of having attended, for two and a half months, instruction in Practical Pharmacy; the certificate to be signed by the teacher, who must be a member of the Pharmaceutical Society of Great Britain, or the superintendent of the laboratory of a public hospital or dispensary, or a registered practitioner who dispenses medicines to his patients, or a teacher of a class of Practical Pharmacy. (*c*) Of having attended for 27 months the Medical and Surgical practice of a public general hospital containing on an average at least 80 patients available for clinical instruction and possessing distinct staffs of physicians and of surgeons. Evidence must be produced that the candidate has acted as Surgical Dresser and Medical Clinical Clerk for not less than three months in the wards in each case, and has received practical instruction in administration of anæsthetics. (*d*) Of having attended for six months the practice of a public dispensary specially recognised by any of the above authorities, or the out-patient practice of a recognised general hospital or of having acted for six months as pupil to a registered practitioner who either holds such a public appointment, or has such opportunities of imparting practical knowledge as shall be satisfactory to the coöperating authorities; this attendance should be made after the student has passed the First and Second examinations. (*e*) Of having been instructed in the Theory and Practice of Vaccination by a Public Vaccinator authorised by the Local Government Board to grant certificates of proficiency in vaccination and of having performed operations under the teacher's inspection during a period of not less than six weeks.

The above Course of Hospital Practice, and the above Courses of Clinical Medicine and Clinical Surgery shall be attended at a recognised Public General Hospital, possessing distinct staffs of Physicians and of Surgeons, and containing on an average not less than 80 patients available for Clinical Instruction.

In addition to the courses above prescribed candidates are required to attend the following courses: Diseases and Injuries of the Eye, three months; Insanity, three months; Infectious Diseases, three months.

The curriculum lasts for five years; the fifth year should be devoted to clinical work at one or more public hospitals or dispensaries. The period of three years devoted to hospital practice may include clinical instruction in special subjects, and must also include instruction in administration of anæsthetics and attendance at post-mortem examinations. The student's regularity of attendance in the wards and out-patients' departments of the hospitals and at the post-mortem examinations should be duly ascertained and noted on the certificate.

Students are recommended to pay particular attention to practical work in connexion with all the departments of study, and to avail themselves of opportunities of acquiring practical acquaintance with special departments of Clinical Study, such as Diseases of the Ear, Throat, and Skin, Diseases of Children, and Operative Surgery. The examinations shall be so conducted as to test practical knowledge.

Candidates shall be subjected to four professional examinations:

First Examination.—The First examination shall embrace the following subjects—(1) Physics, (2) Chemistry, including Practical Chemistry, and (3) Elementary Biology. The fees payable for admission to the First examination shall be for the whole examination, £5; for each subject separately, £3; and for re-entry, £2 10*s*.

Second Examination.—The Second examination shall embrace Anatomy and Physiology including Histology; and candidates may be admitted to this examination at the end of the second year of medical study. The fees payable for admission to the Second examination shall be—for the whole examination, £5, and for re-entry after rejection, £3 for both subjects, and for each of the subjects separately, £3, and for re-entry for each subject after rejection, £2.

Third Examination.—The Third examination shall embrace Pathology and Materia Medica with Pharmacy. The fees payable for admission to the Third examination shall be—for the whole examination, £5; for re-entry in both subjects after rejection, £3; and for each of the subjects separately, £3, and for re-entry for each subject after rejection, £2.

Final Examination.—The Final examination shall not be taken earlier than the end of the fifth year of study and shall embrace the following subjects:—Medicine, including Therapeutics, Medical Anatomy, and Clinical Medicine; Surgery, including Surgical Anatomy, Clinical Surgery, and Diseases and Injuries of the Eye; Midwifery and Diseases of Women and of New-born Children; and Medical Jurisprudence and Public Health, but *it is optional* to candidates who have passed the Third Examination to be admitted to each of the subjects of the Final Examination on lodging certificates of having attended the necessary course or courses in that subject—viz., in Medical Jurisprudence and Public Health at any time; in Medicine and Surgery and Midwifery, at any time after the end of the fifth Winter Session, provided the Final Examination is completed within 15 months of passing any one of the three latter subjects. All candidates shall be subjected, in addition to the written and oral examinations, to clinical examinations in Medicine and Surgery, which shall include the Examination of Patients, Physical Diagnosis, the Clinical use of the Microscope, Examination of the Urine and Urinary Deposits, Surgical Appliances, Bandages, Surface Markings, &c. The fees payable for the Final examination shall be,—for the whole examination, £15, for re-entry in all subjects after rejection, £5, and for each of the subjects separately, £5, with £3 for re-entry in each subject.

Candidates who enter on the footing of having passed the earlier examination at another Board shall pay the fees in respect of these examinations, as well as the Final examination fees.

There are six periods of examination annually, four in Edinburgh and two in Glasgow, and candidates may present themselves at either examining centre irrespectively of the place of the previous examination. The Registrar in Edinburgh is Mr. J. Robertson, solicitor, 54, George-square; and the Registrar in Glasgow, Mr. A. Duncan, LL.D., 242, St. Vincent-street, to whom fees and certificates must be sent for the respective examinations.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH: THE MEMBERSHIP AND FELLOWSHIP.

In addition to the diplomas granted by the Scottish Conjoint Board the Royal College of Physicians grants honour diplomas which no longer give the right to practise professionally if held separately, and also grants its Single Licence to candidates already possessing legal qualifications for professional practice.

[illegible] a [illegible] of the College of Physicians or a graduate of a British or Irish University and 24 years of age, is examined in medicine, therapeutics, and in any branch of the departments of medicine, such as general pathology, psychology, public health, obstetrics, tropical medicine, or medical jurisprudence. A candidate who has attained the age of 40 years and has been distinguished for outstanding scientific attainments may be excused any or all of the examination. The fee for the Membership is £36 15*s.*, 15 guineas of which will be returned to any successful candidate who was already a Licentiate of the College at the time of qualifying for the Membership.

Fellowship.—The Fellows are selected, save with rare exceptions, from the ranks of the *Members.* They must be 25 years of age. The fee is £64 18*s.*

The College grants its *Single Licence* on terms similar to those of the Royal College of Surgeons of Edinburgh, as mentioned in the next section.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH: *THE FELLOWSHIP.*

The Royal College of Surgeons of Edinburgh grants a diploma of Fellowship after examination to the holders of the surgical degrees of diplomas of such British examining bodies, as well as of the holders of such surgical degrees of the Universities of Canada, Australia, New Zealand, and the Indian Empire as are recognised by the College. The candidates for the examination must be 25 years of age and must have been engaged in practice for at least two years. The examination is of a practical nature, partly written and partly *viva voce*, and must include surgery and surgical anatomy, operative surgery, and clinical practice. One optional subject must also be taken, the range of these specialisms covering nearly every branch of medicine. The fee to be paid on entering for examination for Fellowship is £45, £15 of which is remitted to those who already hold the Licentiateship of the College. Candidates rejected at the examination obtain repayment of fee less £10 retained for examination expenses. One month's notice of intention to present himself for examination must be given by the candidate to Mr. D. L. Eadie, 54, George-square, Edinburgh, clerk to the College, together with credentials signed by two Fellows of the College, one of whom must be a resident in Edinburgh, unless a special application be made to the President and the Council of the College. In exceptional circumstances registered medical practitioners who have distinguished themselves in the practice of their profession are admitted to the Fellowship without examination.

The Royal College of Surgeons of Edinburgh admits to the examination for its Single Licence any candidate who already holds a Diploma in Medicine of any British, Indian, or Colonial university or of any British or Colonial College of Physicians, or of the Society of Apothecaries of London or Apothecaries' Hall, Dublin, granted under the provisions of the Medical Act, 1886, whose preliminary examination and course of professional study is proved to be sufficient to fulfil the requirements of the College, or to those who have passed a full examination for any of the above. Female practitioners are now admitted to the Licence of the College but not to the Fellowship, and the regulations for the [illegible] to practitioners of either sex.

[illegible] ma must have followed [illegible] or in an established [illegible] or in a provincial school specially [illegible] s of that division of the [illegible] e.

[illegible] ol of Medicine are comprehended the medical schools of those cities of Great Britain and Ireland in which Diplomas in Surgery are granted, and such colonial and foreign schools as are similarly circumstanced in the countries in which they exist.

SINGLE LICENCE.

Professional Examination for the Diploma of the College.—Candidates for the Diploma of the College will be sub- [illegible] partly in writing and [illegible] ill be presented four [illegible] occasions the candi- [illegible] rs to the questions proposed, and the clinical and oral examinations shall be conducted on the days immediately succeeding.

Unsuccessful candidates will be remitted to their studies for a period to be determined by the judgment of the examiners, but not in any case for less than three months.

The examination will embrace the principles and practice of surgery (including operative surgery and surgical pathology), clinical surgery, and surgical anatomy, and will not take place before the termination of the full period of study.

Applications for examination must be made to Mr. D. L. Eadie, *not later than one week prior to the date of* examination.

On the production of the required documents Mr. Eadie will *give the candidate an order* authorising the examiners to admit him to examination.

The fee of £15 15*s.* payable to the College must be lodged in the hands of Mr. Eadie not later than one week preceding the examination day. The sum of £10 10*s.* will be returned to each unsuccessful candidate. Under special circumstances candidates can be examined on days other than those fixed by the regulations. The fee for a special examination is as follows, viz., £20 for examination, of which £10 will be returned to candidates remitted on examination.

In order to test more effectually the practical knowledge of candidates recent dissections and anatomical specimens will be employed during examination. They will also be subjected to a practical clinical examination in the Surgical Hospital, including the application of surgical apparatus, bandages, surface markings, &c., and may, if it be considered necessary to test their knowledge, be required to perform operations on the dead body.

THE FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

Like the preceding corporations, the Faculty of Physicians and *Surgeons of Glasgow grants a Fellowship and a Licence* to be held as separate qualifications.

Fellowship.—The Fellowship of the Faculty is granted *after examination in medicine or surgery, together with an* optional subject, which may be anatomy or physiology or be selected from any special branch of medicine or surgery, and *14 days' notice must be given by the candidate of his* intention to present himself to Mr. Alexander Duncan, LL.D., the Faculty Hall, Glasgow. The fee for the Fellow*ship is* £30, £10 *of which sum are returned to any successful* candidate who already holds the Licence of the Faculty. An additional sum of £20 is required in the case of candidates resident within *seven miles of Glasgow.* In certain circumstances Fellows may be elected as a mark of distinction.

Licence.—The Licence of the Faculty is granted as a separate qualification [illegible] in Medicine after examination in [illegible] anatomy and clinical surgery.

SCOTTISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS.

The hospitals which are recognised by the Scottish Conjoint Boards, as places where professional study for their diplomas can be pursued are all those institutions which feed the medical faculties of the universities. In addition the Scottish Boards recognise all the places which are recognised by the English Conjoint Board (*see* p. 632) and the Irish Conjoint Board (see p. 654).

III.—IRELAND.

THE UNIVERSITIES.

It is impossible for us to present a complete survey of medical education in the Irish Universities, as they have not yet emerged from the state of transition following upon the passing of Mr. Birrell's Universities Act of 1908 for their *reformation.* It will be remembered that under that Act the old Royal University of Ireland, which is a purely examining body having its headquarters in Dublin and affiliated colleges in Belfast, Galway, and Cork, is in process of dissolution, and in fact is now in its last days. It is to be superseded by two new universities—namely, the University of Belfast and the

National University of Ireland, the latter having headquarters at Dublin, with the old Queen's Colleges at Cork and Galway as its other constituent colleges. The Cecilia-street Catholic School of Medicine will be affiliated to the Dublin College of the National University and will receive a substantial subsidy under the Act for new buildings and equipment. Under the National University the students of the University Colleges of Cork and Galway will be examined by some of their own professors assisted by an extern board from the headquarters in Dublin. The Medical Faculty of the new University of Belfast (to which status Queen's College, Belfast (R.U.I.), has been raised) has completed its revision of the medical curriculum and chosen its teaching staff, and we print below full information on these heads. We understand, however, that the professoriate of the National University of Ireland will not be chosen until October and that the Board of Studies will not set to work to revise the curriculum of the old colleges which form its medical nucleus until a later date. The only University regulations for the granting of Medical Degrees in Ireland now available besides those already rehearsed are those of the rapidly expiring Royal University of Ireland, which we summarised in our last Students' Number (THE LANCET, August 29th, 1908, p. 617). We may anticipate that considerable modifications will be made in the course of study of the medical faculty in the National University of Ireland from those in force in the Royal University. At the same time, it seems probable that no great changes from the old regime can be made during the approaching Winter Session without a disturbance of studies so inconvenient as to be almost impracticable. We will therefore refer those who intend to enter the medical faculty of the new University to a study of the regulations of the Royal University for their present approximate guidance, and would add that the Secretary of the University Commissioners, at the University Buildings, Dublin, might be willing to supply information on any special point of difficulty.

The first of the Irish Universities to fall under notice, by right of seniority, is Trinity College, Dublin, the only one untouched by the recent Act of Reform.

UNIVERSITY OF DUBLIN (TRINITY COLLEGE).

Matriculation.—All students in the School of Physic intending to practise Physic must pass a matriculation examination. This may be either the Public Entrance of Trinity College and a Junior Freshman Term or a special Medical Preliminary, or, for Extern Students, an examination recognised by the General Medical Council. No student can be admitted for the winter course after Nov. 25th.

Degrees in Medicine (M.B.), Surgery (B.Ch.), and Midwifery (B.A.O.).—Candidates for these degrees must be of B.A. standing and must be for at least five academic years on the books of the Medical School, reckoned from the date of matriculation. The Arts course may be concurrent with the medical course and the B.A. degree need not be taken before the final medical examinations, but the medical degrees are not conferred without the Arts degree. The following courses must be attended:—(1) Lectures—Systematic, Descriptive and Applied Anatomy, Chemistry and Practical Chemistry, Surgery and Operative Surgery, Histology, Botany, Zoology, Physics, Physiology and Practical Physiology, Practice of Medicine, Midwifery, Pathology, Materia Medica and Therapeutics, Medical Jurisprudence and Hygiene; (2) three courses of nine months' attendance on the Clinical Lectures of Sir Patrick Dun's or other recognised Dublin Hospital (see p. 654) (two years at a recognised London or Edinburgh hospital before the commencement of the Dublin curriculum may be counted as one year spent in such Dublin hospital); (3) Practical Vaccination, one month's instruction; (4) Mental Disease, three months; (5) Practical Midwifery with Clinical Lectures, including not less than 30 cases, six months; (6) Ophthalmic Surgery, three months. Three groups of examinations have to be passed. Preliminary Scientific Examination, including Physics and Chemistry, Botany, and Zoology. The Intermediate Medical Part I., including Anatomy and Institutes of Medicine (Practical Histology and Physiology). The Intermediate Medical Part II., including Applied Anatomy and Applied Physiology; and the Final Examination, which is divided into Part I., Materia Medica, Jurisprudence, and Pathology; and Part II., Medicine, Surgery, Midwifery, Gynæcology, Clinical Medicine, Mental Diseases, Clinical Surgery, Operations, and Clinical Ophthalmology. Part I. may be passed in the fourth year and Part II. in the fifth year. Fee for the *Liceat ad Examinandum*, £10. Fee for the degrees, £17.

Doctor in Medicine.—A Doctor in Medicine must have passed all the qualifying examinations and must be a B.A. of three years' standing. He must also read a thesis before the Regius Professor of Physic. Total amount of fees for this degree, £13.

Master in Surgery.—A Master in Surgery must be a Bachelor in Surgery of the University of Dublin of not less than three years' standing, and must produce satisfactory evidence of having been engaged for not less than two years from the date of his registration in the study, or study and practice, of his profession. He must then pass an examination in the following subjects: 1. Clinical Surgery. 2. Operative Surgery. 3. Surgical Pathology. 4. Surgery. 5. Surgical Anatomy (on the dead subject), and one of the following optional subjects:—1. Surgery in one of the following branches—viz., Ophthalmic and Aural, Gynæcological and Dental. 2. Mental Disease. 3. Medical Jurisprudence and Hygiene. 4. Advanced Anatomy and Physiology. 5. Comparative Anatomy. Fee for the degree of Master in Surgery, £11.

Master in Obstetric Science.—A Master in Obstetric Science must be fully qualified and produce a certificate of having attended a summer course in Obstetric Medicine and Surgery. He is then required to pass an examination in the following subjects:—1. Practice of Midwifery. 2. Gynæcology. 3. Anatomy of Female Pelvis and Elementary Embryology. 4. Clinical Gynæcology. Fee for the degree of Master in Obstetric Science, £5.

University Diplomas.—Candidates for the diplomas in Medicine, Surgery, or Obstetric Science must be matriculated in Medicine and must have completed two years in Arts and five years in Medical Studies. The Course and Examination necessary for the diplomas are the same as for the degrees. A diploma in Medicine, Surgery, and Midwifery is a registrable qualification conferred upon candidates who have completed a full five years' course in Medicine and two years in Arts. The diploma, like the degree, qualifies for registration. A diplomate, on completing his course in Arts and proceeding to the degree of B.A., may become a Bachelor by paying the degree fees. Fee for the *Liceat ad Examinandum*, £10. Fee for the diplomas in Medicine, Surgery, and Midwifery, £11.

Professors and Lecturers.—Natural Philosophy: F. Purser, M.A. Anatomy and Surgery: A. F. Dixon, D.Sc., M.B. University Anatomist: Sir C. B. Ball, M.D., M.Ch. Physic (Regius): James Little, M.D. Surgery (Regius): Sir C. B. Ball, M.Ch. Surgery: E. H. Taylor, M.D. Botany: H. H. Dixon, D.Sc. Physics: W. E. Thrift, F.T.C.D. Pathology: A. C. O'Sullivan, M.D., F.T.C.D. Institutes of Medicine: W. H. Thompson, M.D., D.Sc. Medicine: J. Magee Finny, M.D. Materia Medica: W. G. Smith, M.D. Midwifery: T. H. Wilson, F.R.C.P. (locum tenens). Jurisprudence and Hygiene: H. T. Bewley, M.D. Chemistry: Sidney Young, D.Sc. Comparative Anatomy and Zoology: H. W. Mackintosh, M.A.

Clinical instruction.—The hospital facilities for clinical instruction available in Dublin will be described below.

QUEEN'S UNIVERSITY OF BELFAST.

Although the new University which replaces Queen's College, Belfast, is not yet formally established, the arrangements of the Medical Faculty are complete, and as the old curriculum has undergone thorough revision and extension we give the new regulations at some length.

1. There are six degrees in the Faculty of Medicine of the University—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (B.Ch.), Bachelor of Obstetrics (B.A.O.), Doctor of Medicine (M.D.), Master of Surgery (M.Ch.), and Master of Obstetrics (M.A.O.). The University also grants a Diploma

in Public Health, particulars of which will be found on p. 667. 2. The degrees of M.B., B.Ch., and B.A.O. are the primary degrees in the Faculty of Medicine, and are conferred at the same time and after the same course of study. No student is admitted to the final examination for these degrees until he has shown: (1) that he is a matriculated student of the University; (2) that he has completed the prescribed course of study in the Faculty of Medicine extending over a period of not less than five academic years from the date of his registration as a student of Medicine by the General Council of Medical Education and Registration of the United Kingdom; (3) that he has passed the several examinations prescribed; (4) that he has attended in the University during three academic years at least the courses of study prescribed for such degrees (the Senate may accept, for not more than two academic years of the required five, courses of study pursued in any other University or School of Medicine approved by the Senate); and (5) that he has attained the age of 21 years. Every candidate for admission as a matriculated student of the University shall pass such Matriculation Examination or fulfil such other test of fitness as may be prescribed by the Senate, which may prescribe the conditions under which students who have passed the Matriculation or Entrance Examination of any other University or College approved for that purpose (or who have fulfilled such other test of fitness as may be prescribed) may be exempted from passing the Matriculation Examination of the University.

The Matriculation Examination.—Entrants to the University who desire to proceed to a degree in the Faculty of Medicine shall be required to pass in five subjects, to be selected from (1) English; (2) Mathematics; (3) Latin; (4 and 5) any *two* of the following (of which *one* must be a Language)—(*a*) Greek, (*b*) French, (*c*) German, (*d*) Physics, (*e*) Chemistry. There shall be two examinations for Matriculation, one in summer and one in autumn. All the subjects offered by a candidate for Matriculation shall be passed at one examination. Entrants (other than those who are matriculated students of the Royal University of Ireland) who have passed the Senior Grade of the Intermediate Education Board for Ireland in the subjects already prescribed in or after the year 1906 shall, on making formal application to the secretary, be admitted as matriculated students. Two examinations for Matriculation, each covering a period of six days, will be held during 1910. They will commence on Mondays, June 13th and Oct. 3rd. Candidates must lodge their entrance forms, duly filled up, with the Secretary, and pay the prescribed fee of £1 1*s.*, not later than May 13th for the summer examination and not later than Sept. 3rd for the autumn examination, or with a late fee of 10*s.*, not later than 14 days before the examination, after which no entry will be received. Entrance forms may be had after April 4th from the secretary.

Entrance Scholarships.—Candidates who intend to present themselves for the Entrance Scholarships to be awarded in connexion with the June Matriculation Examination must give notice to the secretary of the subjects in which they propose to be examined not later than May 13th, 1910. Information as to the scholarships which will be open for competition and the subjects which may be taken will be issued during the first term of the session 1909–10.

PRIMARY DEGREES OF M.B., B.CH., B.A.O.

All candidates for these degrees shall satisfy the examiners in the subjects of four examinations known as the First, Second, Third, and Fourth Medical Examinations respectively. Two examinations for each of these (Pass and Honours) will be held in the spring and summer.

The First Medical Examination.—The subjects of this examination are Chemistry (Inorganic and Organic), Experimental and Practical Physics, Botany and Zoology, and Practical Botany and Zoology. The examination will be divided into two parts which may be taken separately: I., Chemistry, Practical Chemistry and Experimental Physics (including laboratory work); II., Botany and Zoology (including laboratory work).

The Second Medical Examination.—The subjects are Anatomy and Practical Anatomy, Physiology and Practical Physiology. Candidates who have previously passed the First Medical Examination may present themselves for this examination at the close of their second year.

The Third Medical Examination.—The subjects are: [illegible] Pathology; (2) Materia [illegible] erapeutics; (3) Medical [illegible] Candidates who have pre- [illegible] Examination may present themselves for this examination at the close of the third year. Attendance on a course in any subject of the Third Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the First Medical Examination.

The Fourth Medical Examination.—The subjects are: (1) Medicine; (2) Surgery; (3) Midwifery; (4) Ophthalmology and Otology. This examination may be taken in two parts: I., Systematic; II., Clinical, Practical and Oral. Candidates who have previously passed the Third Examination may present themselves for Part I. of the Fourth Examination at the close of the fourth year, provided that they have fulfilled the necessary requirements as to attendance, &c., on the courses of instruction in the subjects of examination. Candidates who have passed Part I. of this examination may present themselves for Part II. at the close of the fifth year, provided that they have fulfilled the necessary requirements as to hospital attendance on the various clinical courses in the subjects of examination. Parts I. and II. may be taken together at the close of the fifth year. Attendance on a course in any subject of the Fourth Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the Second Medical Examination.

Courses of Study.—Candidates who desire to enter for any of the Medical Examinations must furnish satisfactory certificates of attendance on the various courses dealing with the subjects of the respective examinations.

[illegible]

instruction in the conduct of [illegible]
of a medical officer, to have [illegible]
official medical supervision, [illegible]
20 cases of labour, subject [illegible]
he has during one month gi [illegible]
indoor practice of a Lying-in [illegible] Infirmary having a resident medical
general hospital or Poor-law [illegible]

[illegible]

children's ward of a general hospital recognised by the [illegible]
(7) In Mental Diseases and Infectious Diseases. Every student shall [illegible] courses of instruction. [illegible] having [illegible] a teacher [illegible]

The following order of study and examinations is recommended to students entering under the new Regulations in October, 1909:—

First Year.

Winter Session.—Chemistry, Practical Chemistry, Experimental Physics (including Laboratory work), Anatomy (Elementary), and *Practical Anatomy.*

First Examination, Part I. (fee £1 1*s.*).

Summer Session.—Botany, Zoology, and Practical Botany and Zoology.

First Examination, Part II. (fee £1 1*s.*).

Second Year.

[illegible] Physiology, and [illegible] Demonstrations), [illegible]

Third Year.

Winter Session.—Pathology; Materia Medica, Pharmacology, and Therapeutics; Medical Jurisprudence; and Hospital Practice.

Summer Session.—Practical Pathology, Practical Pharmacy, Hygiene, and Hospital Practice.

Third Examination (fee £1 1s.).

Fourth Year.

Winter Session.—Surgery, Medicine, Midwifery, and Hospital Practice.

Summer Session.—Operative Surgery, Ophthalmology, Vaccination, and Hospital Practice.

The following Hospital courses should be taken during the Fourth or Fifth Year:—Diseases of Children, Mental Diseases, Practical Midwifery and Gynæcology, and Fevers.

Fourth Examination, Part I. (Systematic) (fee £1 1s.).

Fifth Year.

Winte[illegible] Surgery, Clinical Gynæcology, [illegible] Practice.

Summ[illegible]

F[illegible], Practical, and Oral Examinations), fee £1 1s.

Admission to degrees of M.B., B.Ch., and B.A.O.—fee £10 10s.

Modified Courses of Study for Matriculated Students of the Royal University of Ireland.

Students who at the beginning of 1909–10 have already finished one year of medical studies and who have passed the First Medical Examination of the Royal University are recommended to take the following courses, subsequently following the courses of study recommended above.

Winter.—Anatomy and Practical Anatomy, Physiology and Practical Physiology, and Practical Chemistry. Examination in Practical Chemistry.

Summer.—Practical Anatomy, Physiology, and Practical Histology. Examination in Anatomy and Physiology.

Students who at the beginning of 1909–10 have already finished two years of medical study and who have passed the Second Royal University Examination are recommended to follow the same course that they would have done under the old Regulations. If, however, a student should desire to adopt the courses of study prescribed by the Regulations of the University, it would be necessary for him to extend his curriculum to six years, as he would be unable to finish Anatomy and Physiology before the end of the third winter at earliest, and most probably not until the close of the third year. Students who at the beginning of 1909–10 have already finished three or more years of medical study are recommended to follow the same course that they would have done under the old Regulations.

DEGREES OF M.D., M.CH., AND M.A.O.

These degrees shall not be conferred until the expiration of at least three academic years, or in the case of graduates of the University in Arts or Science of at least two academic years, after admission to the primary degrees in the Faculty of Medicine. Every candidate must show that in the interval he has pursued such courses of study, or been engaged in such practical work as may be prescribed. These degrees may be conferred by the Senate either (*a*) after an examination, which includes written, oral, clinical, and practical examinations; or (*b*) on the submission of a thesis or other evidence of original study or research, to be approved by the Faculty of Medicine after an oral or other examination of the candidate on the subject thereof. On application for these degrees a fee of £2 2s., and on admission to them a fee of £2 2s., must be paid.

The subjects of the examination for the degree of M.D. are:—The Principles and Practice of Medicine, and one other special subject to be selected by the candidate from: (i.) Human Anatomy, including Embryology; (ii.) Physiology; (iii.) Pathology; (iv.) Pharmacology and Therapeutics; (v.) Sanitary Science and Public Health; (vi.) Forensic Medicine and Toxicology.

The subjects of the examination for the degree of M.Ch. are:—(1) Surgery, Theoretical and Practical, including Ophthalmology and Otology. (2) Surgical Pathology. (3) Surgical Anatomy and Operative Surgery, with the use of surgical instruments and appliances.

The subjects of the examination for the degree of M.A.O. are:—(1) Midwifery. (2) Diseases of Women and Children. (3) Pathology in its special bearing on Midwifery, and Diseases of Women and Children.

Scholarships.—Ten Junior Scholarships have been founded in the Faculty of Medicine of the annual value of £20 each. Two are tenable by matriculated students of the first, second, third, fourth, and fifth years of their course respectively. The examinations for scholarships take place at the commencement of the session. A Travelling Medical Scholarship, value £100, will be awarded in the spring of 1900. Class prizes are awarded at examinations which take place at the close of the session.

The Medical School.—The Donald Currie Chemical Buildings contain a lecture theatre, a preparation room, a chemical museum, a large class-room for elementary practical chemistry, laboratories for qualitative and quantitative analysis, rooms for water and gas analysis, dark room for photographic purposes, balance room, &c., provided with all modern appliances. Special facilities are given to those who wish to pursue original research. The Anatomical Department contains a large and well-lighted dissecting-room, a lecture-room, a professor's and demonstrator's room, a bone-room, and a laboratory for microscopic and photographic work. The Medical Museum is in the same building. The Jaffé Laboratories for Physiology comprise a lecture theatre, laboratories for practical work in chemical physiology, histology, and experimental physiology, and in addition small private research rooms, including balance, galvanometer, and centrifuge rooms. The Musgrave Pathological Laboratory.—In this department opportunity is afforded for research in pathology and bacteriology. The department is in touch with most of the hospitals in Belfast, and there is an ample supply of material for investigation by graduates in morbid histology, clinical pathology, and the bacteriology of infectious diseases. A course in pathology or bacteriology is given to graduates, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in the department for the Public Health Committee of the corporation in connexion with water-supply, sewage disposal, meat- and milk-supply, the diagnosis of cases of infectious diseases, &c. The certificate issued to members of the class in bacteriology qualifies for the D.P.H. degree. The Pharmaceutical Laboratory is fitted and equipped for the work of practically instructing students in the compounding and dispensing of medicines.

The Teaching Staff of the Faculty of Medicine.—Professors—Natural Philosophy: W. Blair Morton, M.A. Chemistry: E. A. Letts, Ph.D., D.Sc. Zoology: Gregg Wilson, M.A., D.Sc. Botany: D. T. Gwynne-Vaughan, M.A. Anatomy: J. Symington, M.D., F.R.S. Physiology (Dunville Professor): T. H. Milroy, M.D., B.Sc. Materia Medica: Sir William Whitla, M.A., M.D. Pathology (Musgrave Professor): W. St. Clair Symmers, M.B. Medicine: J. A. Lindsay, M.A., M.D., F.R.C.P. Lond. Surgery: T. Sinclair, M.D., M.Ch., F.R.C.S. Eng. Midwifery: Sir John Byers, M.A., M.D., M.Ch., M.A.O. Lecturers—Medical Jurisprudence: W. St.C. Symmers, M.B., and T. Houston, M.D. Ophthalmology and Otology: E. Shaw, M.D., M.Ch. Hygiene: W. J. Wilson, M.D., D.P.H. Bio-Chemistry: J. A. Milroy, M.D. Physics: R. Jack, D.Sc. Organic Chemistry: A. W. Stewart, D.Sc. Vaccination: J. M'Liesh, M.B., D.P.H. Assistants and Demonstrators—Anatomy: J. S. Dickey, M.B., R. Hill, M.B., and H. H. B. Cunningham, M.D. Applied Anatomy: P. T. Crymble, M.B., F.R.C.S. Eng. Physiology: J. A. Milroy, M.A., M.D. Practical Pharmacy: V. G. L. Fielden, M.B., Ph.C. Riddel Demonstrator in Pathology and Bacteriology: W. J. Wilson, M.D., D.P.H. Pathological Neurology: W. J. Maguire, M.D., D.P.H. Clinical Pathology: T. Houston, M.D. Medicine: J. E. MacIlwaine, M.D. Surgery: Mr. Howard Stevenson. Midwifery: Dr. C. G. Lowry.

Clinical instruction.—The following institutions are recognised by the University as affording proper opportunities for clinical instruction: the Royal Victoria Hospital, the Belfast Mater Infirmorum Hospital, the Union Hospitals, the Belfast Hospital for Sick Children, the Belfast Maternity, the Ulster Hospital for Women and Children, the Ulster Eye, Ear, and Throat Hospital, the Belfast Ophthalmic Hospital, the Purdysburn Fever Hospital, and the Belfast District Lunatic Asylum.

The staffs of the various institutions are as follows:—

The Royal Victoria Hospital (300 beds).—Physicians: Professor Sir William Whitla, Professor James A. Lindsay, Dr. William Calwell, and Dr. H. L. McKisack. Surgeons: Mr. J. Walton Browne, Professor T. Sinclair, Mr. A. B. Mitchell, and Mr. T. S. Kirk. Gynæcologist: Professor Sir John Byers. Surgeon for Diseases of the Eye, Ear, and Throat: Mr. James A. Craig. Pathologist: Professor W. St.C. Symmers. Physician for Diseases of the Skin: Dr. W. Calwell. Assistant Physicians: Dr. W. B. McQuitty and Dr. J. S. Morrow. Assistant Surgeons: Mr. Robert

Campbell and Mr. Andrew Fullerton. Assistant to the Gynæcologist: Mr. R. J. Johnstone. Assistant Surgeon to the Eye, Ear, and Throat Department: Mr. Henry Hanna. Assistant to the Pathologist: Dr. C. G. Lowry. Administrators of Anæsthetics: Dr. V. G. L. Fielden, Mr. W. C. M. Burnside, and Mr. Norman Barnett. Medical Electrician: Dr. J. C. Rankin. [illegible] ston. Medical Tutor: Dr. S [illegible] Mr. Howard Stevenson. [illegible] and Dr. S. T. Irwin. [illegible]

Ophthalmic Hospital (30 beds).—Dr. J. W. Browne.

Maternity Hospital (32 beds).—Mr. R. J. Johnstone.

Union Infirmary (260 beds).—Mr. R. Hall and Dr. J. M'Liesh.

Fev [illegible] bb.

Dis [illegible]

Ma [illegible] Dr. W. J. Maguire. Surgeon: Sir Peter R. O'Connell. Gynæcologist: Dr. Alexander Dempsey.

Ulster Hospital for Women and Children (28 beds).—Dr. R. W. Leslie.

Queen-street Hospital for Sick Children (45 beds).—Dr. John M'Caw.

Benn Ulster Eye, Ear, and Throat Hospital (30 beds).—Dr. W. M. Killen.

THE NATIONAL UNIVERSITY OF IRELAND.

The proposed statutes of this new University being still before Parliament the University is not yet in formal being, and, as we have said already, neither the regulations of its medical faculty for the granting of degrees nor the composition of its teaching body are yet arranged. We give, however, such information concerning University College, Dublin, and [illegible] Cork and Galway as will be [illegible] en they have been proclaimed [illegible] y University; and we add suc [illegible] a-street School of Medicine in Dublin as is available and likely to be of service to those who join it after its probable affiliation to the National University.

UNIVERSITY COLLEGE, DUBLIN.—The *personnel* of the professorial and teaching staffs of this College have not yet been made public, but for the purposes of our Student's Guide the following information bearing upon the medical faculty will be useful. The new University College, Dublin, will comprise a new Medical School; in fact, the Cecilia-street Medical School, as far as concerns its professors and students, will almost certainly be absorbed by the new College, of which the past students of Cecilia-street are members under the Charter. The Cecilia-street school will, therefore, probably cease to exist as an independent entity. But the school of the Royal College of Surgeons in Ireland will not be affiliated to the National University but will continue as at present. It may apply for recognition as a recognised College of the University; but the recognition cannot be given without the consent of the University College, Dublin. We discussed at some length, when the scheme for the creation of the National University was first made public, the result that the rivalry of the Medical School of University College, Dublin, might have upon the School of the Royal College of Surgeons in Ireland (which includes Carmichael and Ledwich Schools) and we hope that a fair plan for the adjustment of interests will be forthcoming.

UNIVERSITY COLLEGE,[1] CORK: THE SCHOOL OF MEDICINE.—The building is provided with a very large, well-ventilated dissecting room supplied with electric light, with physiological, toxicological, pathological, and pharmaceutical laboratories, materia medica, anatomical and pathological museums, as well as a collection of surgical and obstetrical instruments and appliances. There are well-appointed physical, chemical, and biological laboratories, and a large natural history museum in the adjoining building, and part of the College ground is laid out as a botanical garden. The plant houses are well filled with plants and are open to the students in the class of Botany. The Library contains over 45,000 volumes and is open daily during term time to students. The Medical Museum occupies a large room erected at the northern end of the medical buildings. It consists of (1) an anatomical museum and bone-room, occupying the gallery; (2) pathological museum; and (3) materia medica museum. The two latter collections are on the ground floor. There is a large and representative collection [illegible] smoking, and refreshment rooms, kitchen, and lavatory. There is also a ladies' room for the use of female students. The Rugby Football Club shares the Mardyke ground with two other clubs, and there is also a practice ground within the walls of the College. There are also Gaelic football, Association football, cricket, and athletic clubs, the last of these holding a public meeting once in each year in the Mardyke grounds.

Professors.—Natural Philosophy: W. Bergin, M.A. Chemistry: A. E. Dixon, M.D. Anatomy: B. C. A. Windle, M.D. Physiology: D. T. Barry, M.D. Medicine: W. E. Ashley Cummins, M.D. Surgery: C. Yelverton Pearson, F.R.C.S. Materia Medica: John Dundon, M.D. Midwifery: H. Corby, M.D.

Lecturers.—Medical Jurisprudence: Dr. P. T. O'Sullivan. Pathology: Dr. Arthur E. Moore. Ophthalmology and Otology: Dr. Arthur W. Sandford. Hygiene: Mr. Denis D. Donovan. Osteology: Dr. D. P. Fitzgerald. [illegible] John Taylor. Anatomy: [illegible] Chemistry: Dr. E. V. [illegible] earson. Physiology: Dr. [illegible] hysics: Mr. P. Belas.

Terms.—The First Term will commence on Oct. 19th, 1909, and end on Dec. 22nd. The Second Term will commence on Jan. 10th, 1910, and end on March 23rd. The Third Term will commence on April 5th, 1910, and end with the session on June 11th. Lectures in Chemistry, Experimental Physics, and Zoology will commence on Nov. 3rd, 1909. (*Note.*—The Easter Recess for the Medical Faculty includes the Friday and Saturday before Easter and Easter Monday.)

Matriculation Examination.—The General Matriculation Examination will commence on Oct. 19th, 1909, at 9.30 A.M. Candidates for matriculation should send their names to the Registrar at least three days before the commencement of the examination, stating at the same time the faculty or department which they propose to enter. Before being admitted to examination they are required to pay the College fee for the year amounting to 10*s.* This will be returned, on application, to such as fail to pass the examination. No student will receive a certificate of matriculation until he shall have paid the whole of the class fees for the session and commenced attendance on lectures. Students who have been admitted as matriculated students are required to attend before the president and sign the Roll of Matriculated Students. Students who may be candidates for degrees in the Royal University must have passed the Matriculation Examination of that University, and medical students must have passed a preliminary examination recognised by the General Medical Council. Candidates will be examined in Greek or French or German, Latin, History, Geography, English, and Mathematics.

Admission of Medical Students.—Students in the Faculty of Medicine who have passed the First Professional Examination of the Conjoint Examinations of the Royal College of Physicians and the Royal College of Surgeons in Ireland, or of the Royal College of Physicians and Royal College of Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, or of the Royal College of Physicians, London, and Royal College of Surgeons, England, may be admitted to the rank of second year students on making application to the Council and submitting a certificate of having passed the examination. [illegible] Second Professional [illegible] be admitted to the [illegible] who have passed the Third Professional Examination of the Dublin Colleges, or of the Edinburgh Colleges and Glasgow Faculties, may be admitted to the rank of fourth year students.

Class Fees.—The ordinary fee for a course of lectures is £2. For practical anatomy, practical chemistry, practical physiology, a [illegible]

Residence [illegible] mmodation for the residence of [illegible] but every matriculated studen [illegible] reside during the College terms with his parent or guardian, or with some relative or friend to whose care he shall have been committed by his parent or guardian.

---

[1] At present the formal title of the College is Queen's College, Cork.

Houses of Residence.—St. Anthony's Hall, adjoining the College, is the property of the Franciscan Order. A number of sets of room, together with recreation and common rooms, are provided for lay students who may desire to live there. For full particulars apply to the Very Rev. Superior, St. Anthony's Hall, Fernhurst-avenue. The Ursuline Convent, Blackrock, will open in October a house of residence, quite separate from their Secondary School, for Catholic women students; separate bedrooms, dining, and recreation rooms will be provided. For terms and details apply to the Rev. Mother Superior, Ursuline Convent, Blackrock, Cork.

Scholarships.—There are eight Junior Scholarships for matriculated students, two being given each year for the first four years of the Curriculum. They are of the value of £25 each, are tenable for one year each, and are awarded on the result of examination at the commencement of each session. They are open to matriculated students of either sex. In the fifth year of the curriculum there are available a Scholarship and an Exhibition—viz., the Blayney Scholarship of the value of £32 for one year and the Senior Exhibition of £30 for one year, which are awarded after examination at the commencement of the session. There are in addition three Exhibitions in Practical Medicine, Surgery, and Midwifery respectively. These are of the value of £15 each and are awarded after examination at the end of the medical session. Seven Senior Scholarships of the value of £40 each are awarded to matriculated students who shall have during three College sessions, of which two at least shall have been attended in Queen's College, Cork, attended such courses of lectures and passed such examinations as shall be prescribed by the Council, and who shall have passed the necessary examinations within five years from the date of matriculation in the College. The Senior Scholarships open to the Faculty of Medicine are appropriated as follows: One to Latin and Greek Languages and Literature; one to English and two Modern Continental Languages; one to Logic, Metaphysics (including History of Philosophy), and Political Economy; one to Civil and Constitutional History, Political Economy, and General Jurisprudence; one to Mathematics and Mathematical Physics; one to Experimental Physics and Chemistry; and one to Biology and Geological Science. Students who have passed the Matriculation Examination of the Royal University and intend to be candidates for Scholarships in Medicine the first year are required to send to the College Council, on or before the first day of the session, an application to be admitted matriculated students of the College on that examination, stating the date at which they passed it. The same requirement applies to students who have passed the First, Second, or Third Professional Examination in Medicine and intend to become candidates for scholarships of the second, third, or fourth year in that Faculty. Three Exhibitions, each of the value of £15, one in Practical Medicine, one in Practical Surgery, and one in Practical Midwifery and Gynæcology, will be offered for competition at the close of the lectures in the Faculty of Medicine, in the session 1909–10, by candidates who have been in attendance on one or more classes in the Faculty of Medicine during the preceding session. Candidates for these exhibitions shall not have exceeded five years since the date of registration as a medical student. A gold medal, presented by the late professor of anatomy and physiology, Dr. J. J. Charles, and called the Charles Gold Medal, is offered for annual competition among students attending the advanced courses of Anatomy and Physiology.

Clinical Instruction.—Students may attend the South Infirmary, Cork North Charitable Infirmary, the Mercy Hospital, the Cork District Lunatic Asylum, the Victoria Hospital for Diseases of Women and Children, the County Lying-in Hospital, the Cork Maternity, the Cork Fever Hospital, the Cork District Hospital, and the Cork Ear, Eye, and Throat Hospital.

South Infirmary and County of Cork General Hospital (100 beds).—Staff: Consulting Physician: Dr. P. J. Cremen. Physicians: Dr. T. O'Sullivan and Mr. Norman I. Townsend. Surgeons: Mr. H. R. Townsend, Mr. T. Gelston Atkins, and Mr. Henry Corby. Ophthalmic Surgeon: Mr. A. W. Sandford. Physicians for Extern Patients: Mr. E. W. Allsom and Dr. E. V. Cantillon. Surgeon for Extern Patients: Mr. R. P. Crosbie. Pathologist: Dr. A. E. Moore. Dentist: Mr. T. C. Butterfield. Honorary Secretary: Mr. N. I. Townsend. Clinical instruction is given daily in the wards. Special instruction on Ophthalmic Surgery and Diseases of Women and Children will be given in the special wards for such cases. Fee for perpetual ticket, £18 18*s.*; for 12 months, £8 8*s.*; for six months, £5 5*s.*; for three months, £3 3*s.* Three resident pupils will be appointed by competitive examination. Clinical prizes will be given by the staff at the close of the session.

Cork North Charitable Infirmary and County and City of Cork General Hospital (100 beds). Staff: Honorary Consulting Surgeon: Dr. N. J. Hobart. Physicians: Mr. D. D. Donovan and Dr. Edward Magner. Surgeons: Mr. Jeremiah Cotter, Mr. C. Y. Pearson, Mr. N. H. Hobart, and Mr. D. J. O'Mahony. Assistant Physician: Mr. R. B. Dalton. Assistant Surgeons: Mr. John Dundon and Mr. Richard P. Byrne. Pathologist: Mr. Denis Murphy. Surgeon Dentist: Mr. William Pericho. Dispensing Chemist: Mr. John Murphy. Honorary Secretary: Mr. R. B. Dalton. Clinical instruction is given daily in the wards by the physicians and surgeons. Special instruction is given to Junior Students on two days weekly. Fee for perpetual ticket, £18 18*s.*; for 12 or nine months, £8 8*s.*; for six months, £5 5*s.*; and for three months, £3 3*s.* Three resident pupils are appointed quarterly by the medical staff. All resident pupils are required to be registered pupils of the Hospital.

Mercy Hospital.—Staff: Consulting Physician: Dr. P. J. Cremen. Consulting Surgeon: Dr. J. Cotter. Consulting Ophthalmic Surgeon: Dr. J. J. McMahon. Physician: Dr. D. J. O'Connor. Surgeons: Mr. J. Giusani and Mr. J. Dundon. Ophthalmic Surgeon: Mr. J. M. Browne. Surgeon Dentist: Mr. H. O'Keeffe. Resident Surgeon: Mr. M. A. Shinkwin. This hospital contains 60 beds for medical and surgical cases. There is also a daily extern for medical and surgical cases, as well as for diseases of the eye, ear, and throat. Honorary Secretary to the Staff: Dr. D. J. O'Connor, 38, South Mall.

Cork District Lunatic Asylum.—Psychological Medicine: A course of Clinical Lectures on Mental Disease and Allied Neuroses will be delivered in the Cork District Lunatic Asylum on Mondays and Thursdays, commencing the first Thursday in February, by the Resident Medical Superintendent. All students wishing to enter for the course are expected to attend at the Asylum at 2.30 P.M. on that day. All information may be had at the Asylum.

Victoria Hospital for Diseases of Women and Children (Infirmary-road).—Staff: Honorary Consulting Surgeon: Dr. N. J. Hobart. Honorary Medical and Surgical Officers: Dr. W. E. Ashley Cummins, Dr. C. Yelverton Pearson, Mr. Philip G. Lee, and Mr. N. H. Hobart. There are 70 beds in this hospital, 40 of which are reserved for children. Clinical instruction on Diseases Peculiar to Childhood will be given. The extern department is open daily at 10 A.M For further particulars apply to Dr. N. H. Hobart, honorary secretary, Medical Staff, 33, South Mall.

County and City of Cork Lying-in Hospital (Erinville, Western-road; founded 1798).—Staff: Honorary Consulting Physicians: Dr. W. E. Ashley Cummins, Dr. Cotter, and Mr. D. D. Donovan. Honorary Obstetric Surgeon: Mr. C. Yelverton Pearson. Physicians: Mr. Norman I. Townsend, Dr. N. H. Hobart, Dr. Lucy E. Smith, and Dr. Daniel J. O'Connor. Assistant Physicians: Dr. P. J. O'Brien and Dr. E. V. Cantillon. This hospital contains 20 beds. Fee for six months' attendance, including clinical lectures, £3 3*s.* For further particulars apply to Norman I. Townsend, honorary assistant secretary to staff.

Cork Maternity (Bachelor's Quay).—Staff: Honorary Consulting Surgeon: Mr. H. Macnaughton-Jones. Consulting Obstetric Physicians: Dr. T. Gelston Atkins, Dr. Henry Corby, and Dr. John Booth. Obstetric Physicians: Dr. Richard Crosbie and Dr. Michael Cagney. Three resident pupils are taken into the Maternity. Poor women are attended at their own homes. About 400 are now annually entered on the Maternity register. Clinical lectures are delivered during the session. There is an extern department for the treatment of women's and children's diseases. Fee for attendance at clinical lectures and certificate, £3 3*s.* For further particulars apply to Dr. Henry Corby, secretary to staff.

Cork Fever Hospital.—Staff: Ordinary Physicians: Dr. T. B. Moriarty and Dr. D. J. Flynn. Extraordinary Physician: Mr. T. Callaghan. Resident Medical Officer and Registrar: Mr. A. G. Sutton. Upwards of 200 cases of various forms of f [illegible] in this hospital. [illegible] tion in Practical [illegible] sary for the Royal University and Colleges of Physicians and Surgeons of Edinburgh.

Cork District Hospital (Douglas-road; 1200 beds).—Staff: Dr. W. E. Ashley Cummins, Dr. J. Giusani, Mr. D. Morrissy, and Mr. James T. O'Connor. This hospital includes special buildings for fever and other infectious diseases (100 beds); for children's diseases (100 beds); and a Lock hospital, the only one in the South of Ireland (80 beds). It affords an extensive field for the study of all classes of diseases, acute and chronic, including special departments for gynæcology and diseases of the skin and nervous system. The physicians and surgeons visit the hospitals every morning at 10 o'clock. Lectures and clinical instruction are given daily in the wards by the physicians and surgeons. Three prizes are given at the end of the session for the best clinical reports—one in Medicine, one in Surgery, and one in Fever. Further particulars may be obtained from Dr. W. E. Ashley Cummins, 17, St. Patrick's-place, honorary secretary, medical staff.

Cork Eye, Ear, and Throat Hospital (Western-road).—Staff: Visiting Surgeon: Dr. Arthur W. Sandford. Consulting Physician: Dr. W. E. Ashley Cummins. Consulting Surgeon: Dr. N. J. Hobart. This hospital is open to students attending the Queen's College and others. Certificates of attendance for three or six months can be obtained. The hospital contains 35 beds. Over 4000 cases are treated during the year. Clinical instruction in the Eastern Department is given to students attending the hospital. A course of Lectures and Demonstrations on Ophthalmic Surgery is delivered during the session. For further information apply to Dr. Arthur Sandford, 13, St. Patrick's-place, Cork.

UNIVERSITY COLLEGE,[2] GALWAY: THE SCHOOL OF MEDICINE.—The College contains well lighted and ventilated dissecting-room and anatomical lecture theatre; physiological, pharmaceutical, chemical, and physical laboratories; anatomical, pathological, gynæcological, and materia medica museums; as well as a large natural history and geological museum and an extensive library in which students can read and from which they can borrow books. There are eight Junior Scholarships in Medicine of the annual value of £25 each. Two are tenable by matriculated students of the first, second, third, and fourth years. The Council has power to award exhibitions for distinguished answering. Sessional Prizes are offered in each subject. Scholarship examinations are held at the commencement and those for Sessional Prizes at the close of each session. The Medical lectures are recognised by the various Licensing Bodies in the United Kingdom. Clinical instruction is given in the Galway Hospital and in the Galway Union and Fever Hospitals. The following constitute the medical staff of the Galway Hospital.—Physicians: Professor Kinkead and Professor Lynham. Surgeons: Professor Pye, Professor Colahan, and Professor Brereton. Gynæcologist: Professor Kinkead. House Surgeon: Dr. Rouse. Instruction at the Galway Union and Fever Hospital is given by Professor Colahan and Dr. McDonogh. There are extensive grounds, a portion of which is occupied by a Botanic Garden and a part is at the disposal of the College Athletic Union. A prospectus containing full information as to courses of lectures, scholarships, and fees for classes can be obtained on application to the Registrar, Queen's College, Galway.

Professors—Natural Philosophy: A. Anderson, LL.D. Chemistry: A. Senier, Ph.D. Natural History: R. J. Anderson, M.D. Anatomy and Physiology: J. P. Pye, M.D., D.Sc. Medicine: J. I. Lynham, M.D. Surgery: W. Westropp Brereton, L.R.C.S.I. Materia Medica: N. W. Colahan, M.D. Midwifery: R. J. Kinkead, M.D.

Galway County Hospital (established 1786; 60 beds).—Medical Officers: Dr. N. W. Colahan, Dr. J. P. Pye, Dr. W. W. Brereton, Dr. R. J. Kinkead, Dr. J. I. Lynham, and Dr. T. Rouse. Clerk: Mr. S. J. Leonard. Patients, 800.

THE CATHOLIC SCHOOL OF MEDICINE, CECILIA STREET, DUBLIN.—*Teaching staff*: Anatomy: Mr. E. P. McLoughlin, assisted by Dr. Fagan, Dr. Keating, and Dr. O'Farrell. Physiology: Dr. D. J. Coffey and Dr. C. Coppinger, emeritus professor. Chemistry: Dr. Hugh Ryan, assisted by Mr. G. Ebrill. Surgery: Mr. J. S. M'Ardle, assisted by Mr. A. J. Blayney. Medicine: Sir Christopher Nixon. Midwifery: Dr. Alfred J. Smith. Pathology: Dr. E. J. McWeeney. Physics: Mr. J. A. M'Clelland. Biology: Dr. George Sigerson. Practical Biology: Dr. Michael Curran. Ophthalmology: Dr. Louis Werner. Sanitary Science: Dr. E. J. McWeeney (temporary). Materia Medica: Dr. M. J. Dempsey. Medical Jurisprudence: Dr. E. J. McWeeney (temporary). Practical Pharmacy: Mr. M. R. Hayes. Elementary Biology: Dr. D. J. Coffey. Elementary Physics: Mr. P. J. Fagan.

Method of teaching.—Every effort is made to give students individual instruction and to bring them as closely as possible into contact with their teachers. With this object in view the larger classes are divided into two sections, a junior and a senior, which are taught separately. This affords the teachers an opportunity of giving the members of their classes a considerable amount of direct assistance, and it obviates the practice of lecturing to beginners and advanced students at the same time. A special introductory course is delivered at the commencement of the winter session. This class is specially designed to simplify the course for those who have never worked at medical subjects before. It embraces an elementary course of osteology, a description of the terms and means used in the study of anatomy, and an explanation of the chief difficulties which a student meets at his first steps in medicine. The certificates of attendance at lectures and practical courses in the school are recognised by the various universities and licensing bodies of the United Kingdom, including Conjoint Colleges of Physicians and Surgeons of England, Ireland, and Scotland for the licences of which students are prepared.

Exhibitions and medals.—I. Two exhibitions, value £12 10*s.* each, will be offered for competition amongst the students who shall have completed the first year of their medical studies, and will entitle their holders to free lectures in the following year at the Medical School, Cecilia-street, to the above amount. One of these exhibitions will be awarded to the candidate who shall be adjudged by the President of University College to be the most distinguished student of his year in University College; the other will be awarded to the candidate who shall be adjudged by the Medical Faculty to be the most distinguished conjoint student of his year in the Medical School, Cecilia-street. II. Two exhibitions of £10 each will be offered for competition among the students who shall have completed the second year of their medical studies and taken out all the courses of that year at the Medical School, Cecilia-street. One of these exhibitions will be awarded to the candidate who shall be adjudged by the Medical Faculty to be the most distinguished student of his year among those who are following the programme of the Royal University; the other will be awarded to the candidate who shall be adjudged by the Medical Faculty to be the most distinguished student of his year among those who are following the programmes of any of the other licensing bodies. III. An exhibition of £12 10*s.* will be offered for competition among the third year's Royal University students who shall have taken out all the courses of the *two* preceding years in the Medical School, Cecilia-street. IV. A "Final Conjoint" exhibition of £12 10*s.* will be offered for competition among the unqualified students of the school who are not following the Royal University curriculum and who shall have taken out all the lectures prescribed for the last *three* years of their respective curricula in the Medical School, Cecilia-street.

In connexion with the Scholarships established by the Bishops of Ireland, and administered by the Catholic Scholarships Committee, the Medical Faculty have established a Scholarship of free lectures in the courses delivered in the Medical School for the Degrees of the Royal University in Medicine, Surgery, and Obstetrics. Students of University College, Dublin, obtaining honours in the First Arts Examination are eligible. Information with regard to the conditions under which the Scholarship is tenable may be obtained from the Very Rev. Dr. Delany, S.J., 86, Stephen's-green, Dublin, or from the Registrar of the Medical School. A large gold medal has been offered for competition by his Grace the Archbishop of Dublin, Chancellor of the University, among the students who shall have completed their medical studies and shall have taken out all the school [illegible] their curricula in [illegible] will be awarded [illegible] by the Medical

---

[2] At present the formal title remains Queen's College.

Faculty to be the most distinguished student of his year in the school and deserving of a gold medal. The examination for this medal, which is entirely written, is in the subjects of the Final Qualifying Examination. It will be held in October, and all who have not passed their Final Examination in the preceding June will be eligible. A large Gold Medal will be awarded to the student, if any, who, having taken out all the courses of at least two academical years in the Medical School, Cecilia-street, and taken his primary Medical Degree in the Royal University, with first-class honours, shall be recommended by the Faculty as the most distinguished student of his standing in the school, and deserving of a gold medal.

The Ambrose Birmingham Memorial Prize in Anatomy.—An annual Prize of £7 is offered for competition to students who shall have completed their first two years of medical study in the school. The examination, which will be held in the latter part of October, will be partly written and partly practical. The programme is the same as that prescribed for the Junior Class Medal.

The late Rector of the Medical School, the late Very Rev. Monsignor Molloy, D.Sc., has left an extremely valuable collection of scientific apparatus to the Medical School, and, in addition, a valuable property, the net income from which will provide prizes in Chemistry and Physics, to be competed for by students of the school. Numerous class medals are also, in addition to the above, awarded by examination in the latter half of June.

The school has a medical and scientific society amongst its students. Extensive athletic grounds have been recently acquired by the Medical Faculty at Croydon Park, Fairview, for the use of the students, and are available for the hurling, football, and cricket clubs already established in connexion with the school.

IRISH MEDICAL CORPORATIONS GRANTING DIPLOMAS.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND.

The College issues its Licences in Medicine and in Midwifery to practitioners whose names appear on the Medical Register of the United Kingdom.

The Licence in Medicine.—The subjects of examination are: Practice of Medicine, Clinical Medicine, Pathology, Medical Jurisprudence, Midwifery, Hygiene, and Therapeutics.

The Licence in Midwifery.—Candidates must produce certificates of registration. A registered medical practitioner of five years' standing is exempted from the examination by printed questions.

Fees.—Fee for the Licence to practise Medicine, £15 15*s.* Fee for examination for the Licences in Medicine and Midwifery, if obtained within the interval of a month, £16 16*s.* —to be lodged in one sum. (*Any candidate who has been rejected at the examination for the Licence in Medicine loses this privilege and will be required to pay the full fee of five guineas for the Licence of Midwifery.*) Fee for special examination for the Licence to practise Medicine, £21. Fee for examination for the Licence to practise Midwifery, £5 5*s.* Fee for special examination for the Licence to practise Midwifery, £10 10*s.* The examinations for these Licences are held in the week following the first Friday in February, May, and November.

The Membership.—Examinations for Membership are held in January, April, July, and October. The fee for the examination is £21 to Licentiates of the College, or £36 15*s.* to non-Licentiates. Further particulars can be obtained from the Registrar of the Royal College of Physicians of Ireland, Kildare-street, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

The Licence in Surgery.—Candidates who hold registrable surgical diplomas (including the Licence of the Apothecaries' Companies of London and Dublin granted since October, 1886) are admitted to examination without further evidence of study. Candidates who hold medical qualifications only (including the L.S.A. granted before October, 1886) will be required to produce certificates of two courses of lectures in Anatomy and Dissections, one course of Practical Histology, one course of lectures in Surgery, and one course of Operative Surgery. Candidates are examined in Surgery, Clinical Surgery, Operative Surgery on the subject, Surgical Appliances, and Ophthalmic Surgery. The examination is partly written, partly *vivâ voce*, and partly practical. The fee is £26 5*s.*, of which £5 5*s.* is retained by the College in the case of unsuccessful candidates.

Diploma in Midwifery.—A diploma in Midwifery is granted after examination to persons possessing a registrable qualification. Candidates must produce evidence of (*a*) attendance of a course os lectures on Midwifery and Diseases of Women and Children in some school recognised by the Council; (*b*) attendance on six months' practice in connexion with a recognised lying-in hospital or dispensary for lying-in women and children; and (*c*) of having conducted at least 30 labour cases. The fee for the examination is £15 15*s.*, of which £5 5*s.* is retained by the College in case the candidate is unsuccessful.

Fellowship Examinations.—A candidate for the Fellowship shall make application to the President and Council to be admitted to examination; and if the Council decide to entertain that application it shall lie on the table for at least a fortnight for consideration before it is put to the Council for approval. All the required evidences of study or qualification, fees, and testimonials as to character must be submitted previously to the application being considered, and the candidate shall then, if approved by the Council, be admitted to the next sessional examination or to a special examination if granted by the Council, at such date as the President may fix. In order that these regulations may be carried out candidates are required to lodge their applications complete with the Registrar at least one month before the date of examination. Sessional Fellowship Examinations commence, so far as arrangements permit, on the third Mondays in February, May, and November. Special examinations may be granted at other times by the Council if they see fit, on sufficient cause being shown, except during the months of August and September. Candidates for the Fellowship Examination are divided into two grades: I., Licentiates or Graduates in Surgery of less than 10 years' standing; II., Licentiates or Graduates in Surgery of more than 10 years' standing. Students not either Licentiates or Graduates in Surgery are permitted to present themselves for the Primary Examination under Grade I.

Grade I.—Candidates are required to pass two examinations—Primary and Final. Candidates may present themselves for the Final Examination immediately after passing the Primary part, provided they have complied with the necessary regulations. The subjects for the Primary Examination are (*a*) Anatomy, including Dissections; and (*b*) Physiology and Histology.

The subjects for the Final Examination are (*a*) Surgery, including Clinical and Operative Surgery; and (*b*) Surgical Pathology.

Grade II.[3]—The subjects for examination are (*a*) Surgical Anatomy; (*b*) Surgery, including Clinical and Operative Surgery; and (*c*) Surgical Pathology.

Fees.—Grade I.:—For Licentiates of the College: for Primary Fxamination, £15 15*s.*; for Final Examination, £10 10*s.* For Licentiates in Surgery of other licensing bodies: for Primary Examination, £26 5*s.*; for Final Examination, £15 15*s.* For Students of the College: for Primary Examination, £5 5*s.*; for Final Examination, £21. For Students of other licensing bodies: for Primary Examination, £10 10*s.*; for Final Examination, £31 10*s.* Grade II.:—Licentiates of the College, £26 5*s.*; Licentiates in Surgery of other licensing bodies, £42; extra fee for Special Examination, £10 10*s.*

In case of rejection £10 10*s.*, in addition to the special fee, if such has been paid, is retained by the College and is not allowed in the fees of re-examination.

A rejected candidate will not be again admitted to examination until after a period of three months.

Further particulars can be obtained from the Registrar of the College, Stephen's-green, West Dublin.

ROYAL COLLEGE OF PHYSICIANS AND ROYAL COLLEGE OF SURGEONS, IRELAND.

Every candidate for the Conjoint Examinations of the Colleges shall produce evidence of having before entering on medical studies passed a Preliminary Examination in general education recognised by the Royal Colleges. Each candidate before receiving his diplomas must produce a [illegible] or satisfactory evidence that he [illegible] ars.

---

[3] On and after Jan. 1st, 1910, all examinations for the Fellowship will be conducted under the scheme now known as Grade I. No candidate after the above date will, in any circumstances, be admitted to examination for the Fellowship of this College under the scheme now known as Grade II., which will then cease to be used.

[illegible] —The subjects for examination are identical with those prescribed for the Preliminary Examination by the General Council of Medical Education and Registration.

Professional Examinations.—Every candidate must pass four Professional Examinations—at the end of the first, second, third, and fifth years respectively of his professional studies. No candidate shall be admitted to the Final or Qualifying Examination within three months of his rejection at the Final or Qualifying Examination by any other licensing body.

First Professional Examination.—Every candidate is required, before admission to the First Professional Examination, to produce evidence—(1) of having passed in the subjects of the Preliminary Examination; and (2) of having attended a course of—(*a*) lectures on Theoretical Chemistry, six months; (*b*) Practical Chemistry, three months; (*c*) Biology, three months; and (*d*) Physics.

The subjects of the First Professional Examination are the following:—1. (*a*) Chemistry; (*b*) Physics. 2. Biology. The fee for this examination is £15 15*s.*

Second Professional Examination.—Candidates are not admissible to this examination till they have passed in the subjects of t[illegible] produce ev[illegible] medico-chir[illegible] dissections, six months; and Lectures on (*a*) Anatomy, six months; (*b*) Physiology, six months; (*c*) Practical Physiology and Histology, three months.

The subjects of the Second Professional Examination are the following:—(1) Anatomy; and (2) Physiology and Histology. The fee for this examination is £10 10*s.*

Third Professional Examination.—Every candidate is required, before admission to the Third Professional Examination, to produce evidence of having passed the Second Professional Examination and certificates of having attended courses of instruction in (*a*) the practice of a medico-chirurgical hospital for nine months; (*b*) Pathology—(1) Systematic, (2) Practical, three months each; (*c*) Materia Medica, Pharmacy, and Therapeutics, three months; (*d*) Forensic Medicine and Public Health, three months.

The subjects for the Third Professional Examination are the following:—(1) Pathology; (2) Materia Medica, Pharmacy, and Therapeutics; (3) Public Health and Forensic Medicine. The fee for this examination is £9 9*s.*

Final Professional Examination.—Before admission to the Final Examination candidates must have passed the Third Professional Examination and produced evidence of having attended in Division I. the practice of a medico-chirurgical hospital for nine months (unless such evidence has been perviously produced for admission in Division II.); the practice of a recognised fever hospital or the fever wards of a recognised clinical hospital, three months; clinical instruction in Mental Diseases, one month (12 attendances); Lectures on Medicine, six months at a recognised medical school; of having performed the duties of medical clinical clerk in a recognised hospital for three months. In Division II. of having attended the practice of a medico-chirurgical hospital for nine months (unless such evidence has been previously produced for admission to Division I.); clinical instruction in Ophthalmic and Aural Surgery, three months; lectures on Surgery, six months at a recognised medical school; instruction in Operative Surgery, three [illegible] medical school; of having performed [illegible] for three [illegible] midwifery hospital or maternity and having been present at 20 labours, six mont[illegible] certified [illegible] cluding [illegible] six months at a recognised medical school. Candidates are recommended to present themselves in all the subjects of the Final Examination at one time, but a candidate at or after the end of the fourth year may present himself in any one of the Divisions I., II., or III., provided he has completed his curriculum as far as concerns the division in which he presents himself. The examination in at least one of the divisions must be deferred till the end of the fifth year.

The subjects of the Final Examination are: (1) Medicine, including Fevers, Mental Diseases, and Diseases of Children; (2) Surgery, Operative and Ophthalmic; and (3) Midwifery and Gynæcology, Vaccination, and Diseases of New-born Children. The fee is £6 6*s.* Further particulars can be obtained from the Secretary of the Committee of Management, Royal College of Physicians, Kildare-street, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND (SCHOOLS OF SURGERY).—The schools of surgery are attached by Charter to the Royal College of Surgeons and have existed as a department of the College for over a century. They are carried on within the College buildings and are specially subject to the supervision and control of the Council, who are empowered to appoint and remove the professors and to regulate the methods of teaching pursued. The buildings have been reconstructed, the capacity of the dissecting-room nearly trebled, and special pathological, bacteriological, public health, and pharmaceutical laboratories fitted with the most approved appliances in order that students may have the advantage of the most modern methods of instruction. There are special rooms set apart for lady students. The entire building is heated by hot-water pipes and lighted throughout by the electric light. Winter Session commences Oct. 15th; Summer Session, April 1st. Prospectuses and guide for medical students can be obtained post free on written application to the Registrar, Royal College of Surgeons, Stephen's-green, W., Dublin.

Scholarships and Prizes.—At the College there are offered the Class Prizes: two Gold Medals, two Scholarships, and a Bequest. The Class Prizes having the value of £100 are open to students of the class and are awarded for proficiency in the class examination. The Stoney Gold Medal is confined for competition to the Anatomy Class and the Surgery Gold Medal to the Practical Surgery Class. They are each of the value of £3 15*s.*, and are open to students of the respective classes. The Carmichael Scholarship of the value of £15 is open to students of the third year and is awarded on the result of examination in anatomy, physiology, histology, chemistry, materia medica, and pharmacy. The Mayne Scholarship of the value of £8 is open to students of the third and fourth year and is obtained by merit in the subjects of surgery, medicine, pathology, midwifery, and diseases of women. The Barker Bequest of £26 5*s.* is awarded for the best Dissection and is open to all medical students.

APOTHECARIES' HALL OF IRELAND.

The Licence of this Hall is granted to students who present certificates of having fully completed the course of study as laid down in the curriculum and who pass the necessary examinations. The diploma of the Apothecaries' Hall of Ireland entitles the holder to be registered as a practitioner in medicine, surgery, and midwifery, with also the privileges of the Apothecary's Licence. There are four professional examinations, the total fees for which amount to 21 guineas. Ladies are eligible for the diploma. Registered medical practitioners will receive the diploma of the Hall upon passing an examination in the subject or subjects not covered by their previous qualifications and on paying a fee of 10 guineas. If medicine or surgery be required 5 guineas extra will be charged.

The fees payable for each examination are as follows:—first professional, £5 5*s.*; second, £5 5*s.*; third, £5 5*s.*; final examination, £6 6*s.* If a candidate gives three clear days' notice of his inability to attend he may present himself at the ensuing examination without a further fee. A candidate is allowed for each professional examination which he has completed at any other licensing body except the final. If he has passed in some only of the subjects in a given examination he has to pay the whole of the fee for that examination. The fees for re-examination are for each subject £1 1*s.*, except in the subjects of surgery, medicine, and anatomy, and the fees for which are 2 guineas each. The fee for the third and final or final alone is £15 15*s.* when the other examinations have been taken elsewhere. All examination fees are [illegible] Bank of Ireland, College Green, [illegible] nation Committee. Applications and schedules, together with bank receipt for the fee, must be lodged with the Registrar, Apothecaries' Hall, 40, Mary-street, Dublin, at least 14 clear days before the first day of examination.

There are four examinations—first, second, third, and final. They are held quarterly on the first Monday in January, April, July, and October. The first examination comprises biology, physics, theoretical and practical chemistry (with an examination at the bench). Pharmacy is put down in this examination, but it may be taken at any of the first three examinations. Candidates holding a Pharmaceutical licence are exempt from this subject. The second examination comprises anatomy of the whole body (including practical dissections), physiology, and practical histology. The third examination comprises pathology, materia medica, medical jurisprudence, and hygiene. The final examination comprises medicine, including clinical and oral, surgery, including operations, clinical and oral, ophthalmic surgery, clinical only, midwifery, and gynæcology.

Candidates who desire to obtain the Letters Testimonial of the Apothecaries' Hall in Ireland must before proceeding to the final examination produce evidence of having been registered as medical students for 57 months, also of having attended courses of instruction as follows:—one course each (of six months) of the following: anatomy (lectures), chemistry (theoretical), midwifery, practice of medicine, physiology, surgery, and dissections, two courses of six months each. Courses of three months: materia medica, medical jurisprudence, chemistry (practical), practical physiology and histology, operative surgery, physics, clinical ophthalmology, biology, clinical instruction in mental disease, pathology, and a course in vaccination. Medico-chirurgical hospital, 27 months to be distributed, at the student's own discretion, over the last four years of his study. The candidate may substitute for nine months in this hospital attendance, six months as a resident pupil. He will be required to present a certificate of having taken notes of at least six medical and surgical cases recorded under the supervision respectively of a physician and surgeon of his hospital. Three months' study of fever—which may be included in his 27 months' hospital attendance—in a hospital containing fever wards, and having taken notes of five cases of fever—viz., either typhus fever, typhoid fever, scarlet fever, small-pox, or measles. Six months' practical midwifery and diseases of women during the winter or summer of the third or the fourth year at a recognised lying-in hospital or maternity. Three months' practical pharmacy in a recognised clinical hospital or a recognised school of pharmacy, or a year in the compounding department of a licentiate apothecary or a pharmaceutical chemist. Each candidate before receiving his diploma must produce evidence that he has attained the age of 21 years. Each candidate must produce evidence of having before entering on medical studies passed a preliminary examination in general education recognised by the General Medical Council and of having been registered by that Council as a student in medicine. Certificates of medical study will not be recognised if the commencement of the course to which the certificate refers dates more than 15 days prior to such registration, except in the subjects of physics or biology. This registration is not undertaken by the Hall. The details of the course of education required and syllabus of the examinations will be supplied on application to the Registrar at 40, Mary-street, Dublin.

HOSPITALS AFFORDING PRACTICE RECOGNISED BY THE IRISH UNIVERSITIES AND CORPORATIONS.[4]

ADELAIDE MEDICAL AND SURGICAL HOSPITALS, Peter-street, Dublin.—Fee for nine months' hospital attendance, £12 12*s.*; six months, £8 8*s.* Summer, three months, £5 5*s.*

Staff.—Physicians: Dr. James Little, Dr. Wallace Beatty, Dr. H. T. Bewley, and Dr. G. Peacocke. Surgeons: Mr. F. T. Heuston, Mr. T. E. Gordon, and Mr. L. G. Gunn. Obstetric Surgeon: Sir W. J. Smyly. Ophthalmic Surgeon: Sir H. R. Swanzy. Throat Surgeon: Dr. S. Horace Law. Pathologists and Bacteriologists: Dr. J. Alfred Scott and Dr. W. Geoffrey Harvey. Dental Surgeons: Dr. Theodore Stack and Mr. John Stanton. Assistant Physician: Dr. W. G. Harvey. House Surgeon: Dr. G. Halpin.

Two resident surgeons are elected yearly and four resident pupils half-yearly. At the termination of the session prizes in Clinical Medicine and Surgery and in Dermatology will be awarded.

Hudson Scholarship.—In addition to the junior prizes the Hudson Scholarship, £30 and a gold medal, as well as a prize of £10, together with a silver medal, will be awarded at the end of the session for proficiency in clinical medicine and medical pathology, clinical surgery and surgical pathology, pathological histology, surgical appliances, including instruments and bandaging, ophthalmology, gynæcology, and dermatology.

The certificates of attendance are recognised by all the Universities and licensing bodies in the United Kingdom. Further particulars may be obtained from Mr. F. T. Heuston.

COOMBE LYING-IN HOSPITAL AND GUINNESS DISPENSARY FOR THE TREATMENT OF DISEASES PECULIAR TO WOMEN, Dublin.—This hospital contains nearly 70 beds and consists of two divisions, one of which is devoted to lying-in cases and the other to the treatment of diseases peculiar to women. The practice of this hospital is one of the largest in Ireland; nearly 18,000 cases are treated annually, either as intern or extern patients. Lectures are delivered, practical instruction given, and gynæcological operations are performed in the theatres daily. There is a general dispensary held daily, at which instruction is given on the Diseases of Women and Children. There is a special afternoon dispensary held by the Master and his assistants, at which practical instruction in gynæcology is given. There is no extra charge for attendance at this dispensary. There is accommodation for intern pupils who enjoy exceptional advantages of acquiring a thorough knowledge of this branch of their profession. Lady medical students can reside in the hospital. Clinical assistants are appointed from amongst the pupils as vacancies occur. Certificates of attendance at this hospital are accepted by all licensing bodies, and the diploma is recognised by the Local Government Board as a full legal midwifery qualification. The residents' quarters have been much enlarged. A billiard table is available for the use of students. Fees: Extern pupils for full course of six months, £8 8*s.*; three months, £4 4*s.* Intern pupils, one month, £4 4*s.*; each consecutive month, £3 3*s.*; six months, £18 18*s.*; board and lodging in the hospital, 20*s.* per week. Lady students' intern, one month, £5 5*s.*; each consecutive month, £4 4*s.* Registration fee, in advance, 10*s.* 6*d.* Students can enter for attendance at any time, but preference is given to those entering from the first day of the month. Further particulars may be had on application to the Master or the Registrar at the hospital.

Staff.—Consulting Physicians: Sir John W. Moore and Dr. J. M. Redmond. Consulting Surgeons: Dr. F. T. Heuston and Dr. F. W. Kidd. Pathologist: Dr. E. J. McWeeney. Pathological Analyst: Sir C. A. Cameron. Master: Dr. M. J. Gibson. Assistant Master: Dr. W. D. S. Johnstone and Dr. Victor J. McAllister. Registrar: Fred. A. Heney.

SIR PATRICK DUN'S HOSPITAL, Grand Canal-street, Dublin.—Classes for clinical instruction both in Medicine and Surgery are held each morning from 9 o'clock from Oct. 1st till the end of June. Special classes for students commencing their hospital studies will be held in the wards during the months of October, November, and December. They will embrace the elements of Medicine and Surgery, including note-taking. The surgical operating theatre, which has recently been erected, is equipped upon the most approved principles and is thoroughly in accord with modern surgical requirements. Instruction in the Diseases of Women is given Tuesday and Friday at 10 A.M. There is a special wing devoted to fever cases. Pathological and Bacteriological Demonstrations will be given each Friday at 10.30 A.M. during the Winter and Summer Sessions in the new Pathological Laboratory. A new department has been opened for the special treatment of Throat, Nose, and Ear Diseases under the direction of Dr. R. H. Woods. Instruction will be given in these subjects and in the use of the Laryngoscope and Otoscope to senior students on Mondays and Thursdays. Arrangements have been made to give practical instruction in anæsthetics to senior students.

---

[4] This list of the institutions recognised by the Conjoint Board of Ireland is supplemented in the regulations of the Colleges by those [illegible] Universities.

Opportunities are given the members of the hospital class of seeing the various applications of the X rays to the diagnosis and treatment of injury and disease. Opportunities are also afforded in the out-patient department for the diagnosis and treatment of the numerous minor ailments not met with in the hospital wa[illegible] on Diseases of the Skin. [illegible] appointed annually. The [illegible] December. Four Resident Pupils are appointed each half-year. Six Surgical Dressers and six Clinical Clerks are appointed each month.

Prizes and Medals.—Clinical medals and prizes will be awarded in Medicine and in Surgery respectively in accordance with the will of the late Rev. Samuel Haughton, M.D., S.F.T.C.D. Candidates who fail to obtain these medals and prizes will be awarded special certificates in Medicine and in Surgery *provided they show sufficient merit. The next* examination will be held in April, 1909.

Fees.—Winter and summer session, £12 12*s.*; winter session (six months), £8 8*s.*; and summer session (three months), £5 5*s.* The practice of this hospital is open to students of medicine in attendance on schools other than the School of Physic, the certificates being recognised by the Royal University and Royal Colleges of Surgeons of England, Ireland, and Scotland.

Consulting Physician: Dr. J. M. Purser. Physicians: Dr. W. G. Smith, Dr. J. Magee Finny, Dr. H. C. Drury, and the King's Professor of Midwifery. Assistant Physician: Dr. E. J. Watson. Surgeons: Sir Charles B. Ball, Dr. E. H. Taylor, and Dr. C. A. K. Ball. Pathologist: Dr. A. C. O'Sullivan. Department for Throat, Nose, and Ear: Dr. R. H. Woods. Assistant Surgeon: Dr. C. M. Benson. X Ray Department: Dr. E. J. Watson. House Surgeon: Dr. D. G. Madill.

Further information will be supplied by the Secretary to the Medical Board, *Dr. H. C. Drury.*

JERVIS-STREET HOSPITAL, Dublin.—Founded 1718; rebuilt 1886. 130 beds. In-patients 1908, 1328; out-patients 1908, 14,328. A new out-patient department is nearly completed and will contain all modern requirements. Physicians: Sir William J. Thompson and Dr. F. Callaghan. Surgeons: Mr. W. Stoker, Mr. L. A. Byrne, Mr. D. Kennedy, and Mr. J. L. Keegan. Surgeon to Out-patient Department: Mr. P. Hayden. X Rayist: Dr. H. W. Mason. Gynæcologist: Vacant. Ophthalmic Surgeon: Mr. M. Maxwell. Pathologist: Mr. E. J. McWeeney. Secretary: Mr. Kienian O'Dea.

MATER MISERICORDIÆ HOSPITAL, Dublin.—Consulting Physician: Sir Francis R. Cruise. Physicians: Sir Christopher Nixon, Bart., Dr. Joseph Redmond, Dr. John Murphy, and Dr. Martin Dempsey. Surgeons: Sir Arthur Chance, Mr. John Lentaigne, and Mr. Alexander Blaney. Assistant Physician: Dr. John O'Donnell. Temporary Assistant Surgeon: Mr. D. Farnan. Obstetric Physician: Dr. Robert Farnan. Ophthalmic Surgeon: Mr. Louis Werner. Surgeon for Diseases of Throat and Nose: Mr. Patrick Dempsey. Dental Surgeon: Mr. E. Sheridan. Pathologist: Dr. Edmond McWeeney. *Assistant Pathologist:* Dr. W. D. O'Kelly. Anæsthetist and Surgical Registrar: Dr. Patrick O'Farrell. This hospital, the largest in Dublin, at present containing 345 beds, is open at all hours for the reception of accidents and urgent cases. Clinical instruction will be given by the Physicians and Surgeons at 9 A.M. daily. A course of Clinical Instruction on Fever will be given during the winter and summer sessions. A certificate of attendance upon this course, to meet the requirements of the licensing bodies, may be obtained. Opportunities are afforded for the Study of Diseases of Women in the ward under the care of the Obstetric Physician, and at the Dispensary held on Tuesdays and Saturdays. *Ophthalmic Surgery will be taught in the Special Wards* and in the Dispensary. Surgical Operations will be performed on Mondays, Tuesdays, Fridays, and Saturdays at 11 o'clock. Connected with the hospital are extensive Dispensaries, which afford valuable opportunities for the study of general Medical and Surgical Diseases, and Accidents. Instruction will be given on Pathology and Bacteriology. Two House Physicians, six House Surgeons, and 20 resident pupils will be elected annually. Dressers and Clinical Clerks will also be appointed, and certificates will be given to those who perform their duties to the satisfaction of the staff. Leonard Prizes will be offered for competition annually. For further particulars see prospectus. Certificates of attendance upon this hospital are recognised by all the Universities and licensing bodies in the United Kingdom. Private Wards have been opened for the reception of Medical and Surgical cases. A Training School and a Home for Trained Nurses have been opened in connexion with the Hospital.

Terms of attendance.—Nine months, £12 12*s.*; six winter months, £8 8*s.*; three summer months, £5 5*s.* Entries can be made with any of the physicians or surgeons, or with the Registrar, Dr. Martin Dempsey, 35, Merrion-square. A prospectus containing in detail the arrangements for Clinical Instruction, Prizes, &c., may be obtained from the Secretary, Medical Board.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.—Physicians: Sir John William Moore, Dr. James Craig, and Dr. Edward E. Lennon. Surgeons: Sir L. H. Ormsby, Mr. W. J. Hepburn, Mr. William Taylor, Mr. R. Lane Joynt, and Mr. F. Conway Dwyer. Gynæcologist: Dr. F. W. Kidd. Clinical Assistants: Dr. William Boxwell and Dr. Henry Stokes. Pathologist: *Professor Arthur H. White.* This hospital was founded in 1753 and now contains 160 beds available for clinical teaching. A building containing 40 beds for the isolated treatment of fevers is attached to the hospital. The certificates of this hospital are recognised by all the universities and licensing bodies of the United Kingdom. Six Medical Clinical Clerks and 12 Surgical Resident Pupils and Dressers are appointed every six months, and a House Surgeon and two Clinical Assistants are elected annually. The *session will open on Oct. 1st. A prospectus* giving the complete arrangements for the Medical and Surgical classes for the coming session may be obtained from the Secretary of the Medical Board, Mr. William Taylor, 47, Fitzwilliam-square, Dublin.

MERCER'S HOSPITAL.—This hospital, founded in 1734, is situated in the centre of Dublin, in the immediate vicinity of the Schools of Surgery of the Royal College of Surgeons, the Catholic University School of Medicine, and within five minutes' walk of Trinity College. It contains 120 beds for medical and surgical cases, and arrangements have been made with the medical officers of Cork-street Fever Hospital whereby all students of this hospital are entitled to attend the clinical instruction of that institution and become eligible for the posts of Resident Pupil, &c. There are a large out-patient department and a special department for diseases peculiar to women. There are also special wards for the treatment and study of children's diseases. During the past few years the hospital has undergone extensive alterations in order to bring it up to modern requirements.

Appointments.—A House Surgeon is appointed annually. Five Resident Pupils, each for six months, and Clinical Clerks and Dressers are appointed monthly from amongst the most deserving members of the class.

Fees.—Winter, six months, £8 8*s.*; Summer, three months, £5 5*s.*; nine months, £12 12*s.*

Consulting Physician: Dr. J. Magee Finny. Consulting Surgeon: Mr. H. Fitzgibbon. Consulting Gynæcologist: Dr. J. H. Glenn. Consulting Ophthalmic Surgeon: Mr. J. B. Story. Physicians: Dr. E. L'Estrange Ledwich and Dr. J. Lumsden. Surgeons: Mr. R. C. B. Maunsell, Mr. S. S. Pringle, and Mr. W. Ireland de C. Wheeler. Gynæcologist: *Dr. Gibbon Fitzgibbon. Pathologist and Radiologist:* Dr. W. G. Harvey.

For further particulars apply to Mr. Seton Pringle, Hon. Sec., Medical Board, 27, Lower Baggot-street, Dublin.

NATIONAL MATERNITY HOSPITAL, Holles-street, Dublin.—Established 1894. Masters: *Dr. A. J. Horne* and *Dr. R. J.* White. In-patients, 872; out-patients, 1048.

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS, North Brunswick-street, Dublin.—These hospitals contain 270 beds—86 for Surgical cases, 64 for Medical cases, and 120 for Fever and other Epidemic Diseases.—A Resident Physician and a Resident Surgeon are appointed each half year and are paid for their services. 12 Resident Clinical Clerks are appointed each quarter and provided with furnished apartments, fuel, &c. These appointments are open not only to advanced Students but also to those who are qualified in Medicine and Surgery. The Dressers are selected from among the best qualified of the pupils without the payment of any additional fee. For prospectuses apply to Sir W. Thomson, C.B., Hon. Treasurer, 54, Stephen's-green East; or to Dr. Travers Smith, Hon. Secretary, 20, Lower Fitzwilliam-street, Dublin.

ROTUNDA HOSPITAL, Dublin.—This institution is the largest combined gynæcological and maternity hospital in the British empire. Qualified men who take out a course of three months' duration during the autumn, winter, or spring periods obtain (if they show keenness and capacity) one or more forceps applications and a certain number of minor gynæcological operations. Unqualified students can also enter at any time for the practice of the hospital and have access, not alone to the maternity and gynæcological wards, but also to the pathological laboratory attached to the hospital. The residential quarters have undergone considerable improvement and afford comfortable accommodation. Valuable appointments are periodically filled by qualified students who have obtained the hospital diploma. Women students can reside in the hospital on terms similar to those enjoyed by men. Master: Dr. E Hastings Tweedy. Assistants: Dr. B. A. H. Solomons and Dr. J. R. Freeland. Pathologist: Dr. R. J. Rowlette. Resident Extern-Maternity Assistants: Dr. H. G. Massy-Miles and Dr. W. E. Tulloh. For further particulars apply to Dr. E. Hastings Tweedy, Master.

ROYAL CITY OF DUBLIN HOSPITAL.—Founded 1832; enlarged 1851; rebuilt 1893. 120 beds. Consulting Physician: Dr. H. Benson. Physicians: Dr. A. R. Parsons and Dr. T. G. Moorhead. Consulting Surgeon: Mr. H. Fitzgibbon. Surgeons: Mr. G. J. Johnston, Mr. H. Moore, and Mr. R. A. Stoney. Ophthalmic and Aural Surgeon: Mr. A. H. Benson. Gynæcologist: Mr. R. H. Fleming. Anæsthetist: Mr. O. E Boyce. Dental Surgeon: Mr. D. L. Rogers. Secretary: Mr. T. Spunner.

ROYAL VICTORIA EYE AND EAR HOSPITAL, Dublin.—Established 1844. Incorporated 1897. 82 beds. Consulting Physician: Dr. J. Little. Consulting Dental Surgeon: Mr. A. W. W. Baker. Surgeons: Sir Henry Swanzy, Mr. J. B. Story, and Mr. A. H. Benson. Junior Surgeon: Mr. P. W. Maxwell. Assistant Surgeons: Mr. L. Werner, Mr. R. J. Montgomery, Mr. H. C. Mooney, and Mr. F. C. Crawley. Physician to Dispensary for Throat: Dr. R. A. Hayes. Surgical Radiographer: Mr. W. S. Haughton. Registrar: Mr. E. Parker. In-patients, 1428; out-patients, 9548.

DR. STEEVENS' HOSPITAL, Dublin.—Established 1720. 200 beds. Consulting Physicians: Dr. J. Little, Dr. J. M. Purser, and Dr. H. C. Tweedy. Consulting Surgeon: Sir C. B. Ball. Physicians: Dr. R. A. Hayes and Dr. T. P. C. Kirkpatrick. Assistant Physician: Dr. W. A. Winter. Surgeons: Mr. R. B. McCausland, Mr. R L. Swan, and Mr. W. S. Haughton. Assistant Surgeon: Mr. W. C. Stevenson. Anæsthetist: Mr. J. J. Purser. Obstetric Physician and Gynæcologist: Dr. H. Jellett. Ophthalmic and Aural Surgeon: Mr. J. B. Story. Pathologist: Mr. R. L. Rowlette. Dental Surgeon: Mr. G. M. P. Murray. Resident Surgeon: Dr. W. L. Hogan. Secretary; Mr. G. E. Pepper. Patients, 1208.

ST. VINCENT'S HOSPITAL AND DISPENSARY, Dublin.—Established 1834. 160 beds. Physicians and Lecturers on Medicine: Dr. M. F. Cox, Dr. M. McHugh, and Dr. W. J. Dargan. Physician for Extern Department: Dr. J. Meehan. Surgeon for Extern Department: Mr. R P. McDonnell. Surgeons and Lecturers on Surgery: Mr J. S. McArdle, Mr. R. F. Tobin, and Mr. P. J. Fagan. Gynæcologist and Lecturer on Gynæcology: Mr. A. J. Smith. Ophthalmic Surgeon and Lecturer on Diseases of Eye and Ear: Mr. F. Odevaine. Pathologist and Lecturer on Pathology: Dr. T. J. O'Farrell. Surgeon-Dentist and Lecturer on Dentistry: Mr. J. J. Murphy. Pharmacist and Lecturer on Pharmacy: R. Shaw.

UNIVERSITY OF BRUSSELS.

British and other practitioners holding registrable qualifications are admitted to the examination for the Doctorate of the University of Brussels without further curriculum. It is essentially a practitioner's examination and is separate from that intended for the Belgian students who take up the medical curriculum of the University. The fees are—For matriculation, £8 12*s.*; for 1st Part, £4 4*s.*; for 2nd Part, £4 8*s.*; for 3rd Part, £4 8*s.*; for legalisation of diploma, 8*s.*—total, £22. Candidates who have paid in advance the fees for the three examinations, and are unsuccessful in the first, recover the fees paid for the second and third; those who fail in the second recover the fees paid for the third examination. Unsuccessful candidates are allowed to come up again three months after rejection on payment of examination fees only, provided this second appearance be in the course of the same academical year (October 1st to June 30th), otherwise they must renew the payment of the matriculation fee of £8 12*s.* The examination consists of three parts, viz.—1st Part: General Medicine; Materia Medica and Pharmacology; General Surgery; and Theory of Midwifery. 2nd Part: General Therapeutics; Pathology and Morbid Anatomy, with use of the microscope; Special Therapeutics and Medicine of Internal Diseases, including Mental Diseases; and Special Surgery. 3rd Part: Public and Private Hygiene; Medical Jurisprudence; Clinical Medicine; Clinical Surgery; examination in Operative Surgery, [illegible] of the usual operations on the dead subject—viz., Amputation, Ligature of an Artery, &c.; Ophthalmology; examination in Midwifery, consisting in obstetrical operation on the mannikin (model of pelvis); and examination in Regional Anatomy with Dissection. The time required for the three examinations seldom exceeds ten days, and is usually less. Candidates have the option of passing each part separately or of taking the three together, and the latter is the usual course; also of demanding a written examination on payment of an additional fee of one guinea for each part, a rule of which candidates rarely or never avail themselves. The examinations, which are *vivâ voce*, begin on the first Tuesday in November, December, March, May, and middle June. Candidates should appear with their medical registration certificate or their diplomas at the Secretary's office not later than 2 P.M. on the day preceding the examination. Most of the examiners speak English and those who do not examine through the medium of an interpreter. Great importance is attached to practical knowledge, but candidates must also possess sound theoretical knowledge, the standard required varying with the subject. Pathological and other specimens are not usually shown. There are in England at present over 600 graduates holding this degree, and a British Association of Brussels Medical Graduates has been in existence for many years. Applications should be made to the Secrétariat, 14, Rue des Sols, Bruxelles.

THE NAVAL, MILITARY, AND INDIAN MEDICAL SERVICES.

THE conditions of service in the medical departments of the Navy, Army, and Indian Army remain practically the same as for 1908. There is no new warrant or important modification of regulations calling for particular comment; and except to lay stress on the fact that the military services now offer a better opening to young medical men than they have ever done we do not propose to make any special reference to them. The terms of the warrants sufficiently explain t[illegible]

With [illegible] Medical Service a few prefatory words are needed, for we have from time to time published articles dealing with the considerable amount of dissatisfaction which exists therein, while in summarising communications from our correspondents we came to the inevitable conclusion that some of the unfavourable criticism was just. We would strongly urge on the authorities the advisability of removing legitimate grievances *now;* the reforms could for the most part be effected at the expense of little but tact and a consideration of what is justly due to the naval medical officers. Every naval medical officer who has written to our columns, and this is not a small number, has expressed dissatisfaction with the position in which the cabin question has been left by recent regulations. Allotment to the medical officer of cabin accommodation inferior to that to which he is entitled still takes place, and cannot, at any rate cannot always, be explained by the cramped space on that elaborate box of tricks, a modern man-of-war. Another innovation sadly wanted is a regulation to ensure that the senior medical officers in hospitals should have proper disciplinary power over their subordinates and patients. Other points, the supply and use of boats, for example, and the payment in certain grades, might well be settled in accordance with the just desires of the Naval Medical Service, *for the* Admiralty will be prudent to *aim at making* the Service more popular. And the same may be said of all three services. For that there is now no competition for commissions in the Naval Medical Service and no keen competition for those in the Army Medical Corps or the Indian Medical Service seems undeniable, and this is the more unfortunate a position that fewer men are now entering the medical profession as a whole. It is no longer easy for all hospitals to obtain suitable residents, while assistants are scarce and even junior partners are not to be found directly they are wanted. The Services will therefore have to be careful to increase their popularity, and the point is that it may be economical of them to do so now. By small concessions they may be avoiding having later to pay a heavy price to attract men. We would also suggest that it is unwise to let any of these departments run below the normal strength if it is possible to maintain them at par.

Though reform may be wanted in the Naval Medical Service, its present state is not without material advantages. At one time not so very long ago the Naval Medical Service was not looked upon as one in which an educated gentleman could serve with dignity, while complaints were heard of many of the conditions of service. But the old order of things is giving place to the new, and a comparison of the lot of the naval medical officer with that of the civil practitioner will show that the trials of the civil branch of the profession are greater than those of the naval branch, and probably when all things are considered the naval surgeon is in a far better position than the average lay professional man. In the junior ranks of the Service the pay is better than the average income of the lay medical man of the same age, and promotion is not always slow. With £20 a month the young naval surgeon can, if he is not extravagant, get along very comfortably, though he will require at the commencement of his career £100 for outfit. A private income is certainly not necessary though it is eminently desirable. After 20 years of service a naval surgeon is entitled to a pension of £350 a year, which compares very favourably with the prospects of many medical men on the civil side of the profession, and in case of illness there is the half-pay rate, while pensions are provided for widows and children. In this way the young naval officer is relieved of the most serious anxiety which can press upon a married man, but he ought not to marry young without due consideration, a warning which, however, applies to most medical men. With regard to the Medical Services of the Army and Indian Army, a comparison with that of the Navy shows that though the Army and Indian Service are better paid, expenses are higher and the work more fatiguing, while in the Indian Service there is a greater liability to disease and death. The young surgeon, too, on board his vessel probably gets a better chance in the Navy than in the Army. So long as the new surgeon is moderately good at his profession, is kind and unselfish towards his patients, is not too self-assertive, and has any positive accomplishments or skill at any sport or game, he should get on very well, especially if he is good-humoured and helpful. And if a man has not these qualities and readiness where should he be advised to practise?

ROYAL NAVY MEDICAL SERVICE.

REGULATIONS FOR THE ENTRY OF CANDIDATES FOR COMMISSIONS IN THE MEDICAL DEPARTMENT OF THE ROYAL NAVY.

[illegible]

or abroad, as required; (b) whether he holds, or has held, any commission or appointment in the public services; and (6) that he is

[1] If any doubt should arise on this question the burden of clear proof that he is qualified will rest upon the candidate himself.

failure to pass the qualifying examination he will, should he pass and be promoted, be dealt with as follows. He will be granted the seniority as Staff Surgeon he would have received had he passed in ordinary course. He will reckon service for increase of full and half pay only from the date of appointment to full pay as Staff Surgeon. If on half pay, or if placed on half pay when promoted, he will receive the lowest rate of half pay of the new rank from the date of passing the qualifying examination Where delay in passing the qualifying examination may be due to unavoidable circumstances special consideration will be given. (*d*) The seniority of surgeons on entry will be determined by the sum total of the marks they obtain at the London examination and those at the conclusion of the Haslar course and their names will then be placed in the official navy list, except in the case of candidates who hold, or are about to hold, a post as resident medical officer or surgical officer to a recognised civil hospital. These candidates will retain the position in the list which they obtained on entry, and when their period of service as resident officer is over they will join the next Haslar course and will be [illegible] Surgeons entered without compe[illegible] last surgeon entered at the same [illegible] tion for promotion to the rank o[illegible] mining Board, to which a naval [illegible] duct the examination in naval hygiene. The subjects of examination will be in writing and will include medicine, surgery, pathology, general hygi[illegible] promotion to the rank of staff surgeon may [illegible] who, before entry, have held the post of [illegible] dical or surgical officer to a civil hospit[illegible] ls for a period of not less than six months, provided their conduct and professional abilities have been [illegible] g the time they have served in the Navy. [illegible] months to one year's seniority, according [illegible] heir civil appointments, but in no case will more than one year's seniority be granted. This only applies to officers who enter by competition. (*f*) A candidate who at the time of passing the examination for entry into the medical branch of the Royal Navy holds, or is about to hold, an appointment as resident medical or surgical officer in a recognised civil hospital, may be allowed to serve in such civil appointment provided that the period of such service after the date of entry into the Royal Navy does not exceed one year. Pay from naval funds will be withheld from officers while thus serving, but the time concerned will reckon for increase of full and half pay while on the active list, and retired pay or gratuity on retirement or withdrawal, except that no officer will be allowed to retire on a gratuity until he has completed four years' service exclusive of the time spent as resident medical or surgical officer. The eligibility of this appointment will also be decided by the Medical Director-General.

Full Pay and Allowances.

Rank.	Daily.	Yearly.
Surgeon—	£ s. d.	£ s. d.

The medical officers in charge of the following hospitals and sick quarters will be granted charge pay: Haslar, Plymouth, Chatham, Malta, Hong-Kong, Bermuda, Portland, Yarmouth, Haulbowline, Cape, Gibraltar, and Yokohama. The rate of charge pay will be as follows:—

	s.	d.	
Inspectors-General...	10	0	a day.
Deputy Inspectors General	7	6	"
Fleet Surgeons of over 4 years' seniority	5	0	"
Fleet Surgeons of under 4 years' seniority and Staff Surgeons	2	6	"

The hospital allowances for naval medical officers at home and abroad, in lieu of provisions, for themselves and servants, and for fuel and lights, are as follows:—

—	At home.	Abroad.
	£	£
Deputy Inspectors-General	67	112
Fleet Surgeons and Staff Surgeons of over 4 years' seniority	53	112
Staff Surgeons of under 4 years' seniority and Surgeons...	39	108*

* Except at Malta, where the allowance will be £70, but servants will be provided at the public expense. These allowances are also granted to medical officers of marine divisions and dockyards

An allowance of 5*s*. a day, in addition to full pay, is granted to the senior medical officer, being a Fleet or Staff Surgeon, of a flag-ship bearing the flag of a Commander-in-Chief. An allowance of 2*s*. 6*d*. a day is granted to the senior medical officer, being a Fleet or Staff Surgeon, of the ship bearing other flags or broad pendants The following charge allowances may be granted to medical officers in charge of hospital ships: if above the rank of fleet surgeon, 5*s*. a day; and if of the rank of fleet surgeon or junior, 3*s*. 6*d*. a day. The Fleet and Staff Surgeons serving in the Admiralty and the Marine Rendezvous will be granted the Hospital allowance of £53 a year in addition to the usual lodging money. Medical officers conducting the course of instruction at Haslar Hospital will receive the following allowances: two senior officers employed upon this duty, £150 a year each; the junior officer assisting, £50 a year; and the junior officer instructing the Sick Berth Staff, £50 a year. The junior officer instructing the Sick Berth Staff at Plymouth, £50 a year. Medical officers employed elsewhere than at a hospital, and not victualled in kind, receive an allowance of 1*s*. 6*d*. a day in lieu of provisions, fuel, and lights. The travelling allowances, extra pay, lodging money, and compensation for losses are fixed for naval medical officers according to their relative rank in the service.

Half Pay.

Rank.	Daily.	Yearly.
Surgeon—	£ s. d.	£ s. d.

" 4 " "	1 9 0	529 5 0
Inspector-General	1 18 0	693 10 0

Candidates will do well to notice that the regulations issued to applicants do not put any limit on the amount of half-pay service which they may be compelled to undergo.

Retirement.

Compulsory retirement will be as follows:—

Inspector and Deputy Inspector-General of Hospitals and Fleets.	At the age of 60, or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non-employment in any two ranks combined. Except that if in any particular case the Lords Commissioners of the Admiralty may consider that the interests of the public service will be materially advanced by the further retention of an Inspector-General of Hospitals and Fleets on the active list, the age for the retirement of such Inspector-General may be extended to 62.	To be retired irrespective of age if found physically unfit for service.
Fleet Surgeon, Staff Surgeon, and Surgeon.	At the age of 55, or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non-employment in any two ranks combined.	

The special attention of candidates is directed to the following rules under which officers are allowed to withdraw from the service after four years' full pay service in the Royal Navy, with the advantage of joining the Reserve of Naval Medical Officers:—

After four years' service in the Royal Navy, an officer, if he wishes, may pass from active service to the Reserve of Naval Medical Officers, when he [illegible]

(1) He [illegible] passing into the Reserve.

(2) His [illegible] y List; he will retain his naval rank and be entitled to wear his naval uniform under the regulations applying to officers on the retired and reserved lists of His Majesty's Navy.

(3) If he agree to remain in the Reserve for four years he will receive a retaining fee of £25 per annum. If at the expiration of this period he agree to remain in the Reserve for a further period of four years he will continue to receive the same retaining fee.

Should an officer prefer it, however, he may simply enter the Reserve for a period not exceeding eight years, with power to give six months' notice of his intention to resign his position at any time (in which case he will receive no retaining fee). He may also adopt this method of Reserve service after the expiration of four years served under the conditions referred to in (3), by renouncing his retaining fee for his last four years' service in the Reserve.

No officer will be allowed to remain in the Reserve for a longer period than eight years.

Officers of the Reserve will be liable to serve in the Royal Navy in time of war or emergency. When called up for such service they will receive the rate of pay—viz., 17*s*. a day [illegible] to which they [illegible] after four years [illegible] llows. [illegible] and withdrawa[illegible] have the option, subject to their Lordships' approval, of retiring after 20 years' full-pay service on the scale of retired pay provided in Paragraph 16, or with a gratuity on the scale provided in that paragraph if not eligible for retired pay. (*b*) At the expiration of four, eight, 12, or 16 years' full-pay service every officer will be [illegible] approval to withdraw from the [illegible] Paragraph [illegible] m the list of the Navy, with which all connexion will then be severed, except in the case of officers who withdraw after four years who are liable to serve in the Reserve. (c) Voluntary retirement and withdrawal at the discretion of their Lordships will be allowed, as a rule, only when an officer is unemployed or serving at home. Under special circumstances, however, it may be permitted in the case of an officer serving [illegible]

reserve to themselves power to remove any officer from the list for misconduct.

Gratuities and retired pay will be awarded on retirement and withdrawal on the under-mentioned scale—

Rank.	Gratuities.	Daily.	Yearly.
	£ s. d.	£ s. d.	£ s. d.
Surgeon, Staff Surgeon, and Fleet Surgeon—			
After 4 years' full-pay service...	500 0 0	—	—
After 8 years' full-pay service (including service allowed by Para. 4 (*f*)) ...	1000 0 0	—	—

* To obtain this rate an officer must hold the commission of Fleet Surgeon.

[illegible]

rate of £125 for each year of full pay service.

[illegible]

civilians.

Widow's Pension.

When an officer retires or withdraws *on a gratuity* his widow and children will have *no claim* to pension or compassionate allowance. In respect to other officers on the active or retired list, the widow's pension ranges from £50 per annum for a surgeon's widow up to £120 for the widow of an Inspector-General; for each child an allowance is granted ranging from £9 to £20 per annum. Officers serving in the [illegible] on duty, or lose their [illegible] come under the same [illegible] elves, or pensions and [illegible] children, as officers of [illegible]

Miscellaneous.

[illegible]

The Admiralty has made a considerable effort to make the Medical Service attractive to men of a good professional stamp. By the regulations promulgated in 1903, promotion was accelerated, special promotion in the lower grades was [illegible] conspicuous [illegible] the service, [illegible] men who have held residen[illegible] hospitals. A feature of the present [illegible] to withdraw at the end of four [illegible] £500. The pay has been increa[illegible] vances, the medical officers of the navy, up to the senior ranks, are not as well off as those of the Royal Army Medical Corps. In spite of the steps taken by the Admiralty there is still much discontent among naval medical officers, and such discontent will exist until the medical officers are unhampered in the performance of their important work by the executive officers. The medical officers should have control over the sick bay staff in ships, and over nurses and other attendants in hospitals, and executive officers should no longer figure as presidents of "medical surveys." The authority of the Director-General must be made adequate. More care must also be taken that medical officers are assigned fitting cabin accommodation. To make the service thoroughly efficient the medical officers must be given authority and position commensurate with their responsibilities, as has been done in the case of the Engineer department. A committee, presided over by Vice-Admiral Sir J. Durnford, was appointed last February to inquire into these matters, whose report may shortly be looked for.

ARMY MEDICAL SERVICE.

During recent years the medical service of the Army has passed through many stages of evolution, and we consider [illegible]

War Minister, marked the first great step; then came a period of strain during the war in South Africa, when the medical services were exposed to fierce criticism. The outcome of this was the appointment of a committee of inquiry in 1901 by Mr. Brodrick (now Lord Middleton), over which he himself presided. This committee included many eminent civilian members of the profession; their chief recommendations were that an advisory board should be constituted, comprising civilian as well as military medical members; that the pay of the medical service should be substantially increased all round; that advancement should be, at any rate in some considerable degree, dependent on professional merit, and not, as hitherto, almost entirely by seniority; that, by granting special leave for professional study, and by providing post-graduate training at the Army [illegible]

for educational training and scientific investigation, and [illegible] should serve as a centre for [illegible] the corps. By this step, an [illegible] advisory board at the War [illegible] professional men, the med[illegible] brought into close relations with the great London hospitals and their staffs, and the civilian heads of the profession;

---

[3] If the health of a surgeon breaks down before he completes 20 [illegible] Service or be [illegible] on the retired [illegible] if noted, as it is [illegible]

and there can be no doubt that great benefit has resulted therefrom. There is now a much stronger and livelier professional feeling in the corps, and this results in a keener devotion to work all round than was the general rule in former days. It is certainly the case that from the scientific and professional standpoint the Royal Army Medical Corps offers a much better prospect than at any previous time; there is now not only opportunity, but encouragement, for a man to perfect himself in some particular branch, it is made worth his while to do so, and advancement in some considerable degree depends upon his professional zeal and capabilities. A Royal Warrant embodying the recommendations of Mr. Brodrick's committee was issued in 1902, which regulates the existing conditions of service; in 1907 free passages to India were granted for the wives and families of medical officers, whether employed on duty or not, an important concession, and one evidencing the liberal spirit of the War Office towards the medical service.

REGULATIONS FOR ADMISSION TO THE ROYAL ARMY MEDICAL CORPS (ISSUED WITH ARMY ORDERS DATED JUNE 1ST, 1909).

A candidate for a commission in the Royal Army Medical Corps must be 21 years and not over 28 years of age at the date of the commencement of the entrance examination. He must, at the time of his appoi[illegible]ical Acts in force in the United [illegible] to the subjoined form of applic[illegible]o the Director-General, A.M.S., [illegible] to the medical school in which the candidate completed his course as a medical student.

*Application of a Candidate for a Commission in the Royal Army Medical Corps.**

(N.B.—It is of great importance that the names given in the birth certificate should be correctly given on this form, and it is to be clearly understood that when they differ the names and date of birth given in the birth or baptismal certificate will be accepted for official record.)

1. Name in full... ... ...
2. Address ... ...
3. Date of birth † ... ...
4. Nature and date of examination qualifying for registration ... .
5. Date of registration as a medical student ... ...
6. Dates of passing medical examinations—
   First ... ...
   Second ... ...
   Final ... ...
7. Qualifications ... ...
8. Academic and other distinctions ... ...
9. Medical school or schools in which the candidate pursued his course as a medical student, and name or names of the deans or other responsible authorities ....
10. Particulars of any commission or appointment held in the public services, including service in the officers training corps ... ...
11. Date of examination at which the candidate proposes to present himself ... ...

Declaration.

(N.B.—A mis-statement by the candidate will invalidate any subsequent appointment and cause forfeiture of all privileges for services rendered.)

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief and further:—

1. That I am a British subject of unmixed European blood.

2. That I am not, as far as I know, at present suffering from any mental or bodily infirmity, or physical imperfection or disability that is likely to preclude me from efficiently discharging the duties of an officer in any climate.

3. That I will fully reveal to the Medical Board, when physically examined, all circumstances within my knowledge that concern my health.

I also declare that my vision is good with either eye (with or without the aid of glasses as the case may be).

Signature ....
Date ....

* All communications to be addressed to the Secretary, War Office, Whitehall, S.W.

† A certificate of registration of birth to be furnished.

The dean, or other responsible authority, of the candidate's school will be requested by the Director-General to render a confidential report as to his character, conduct, professional ability, and fitness to hold a commission in the corps. A candidate whose application is regarded as satisfactory will be directed to appear before the Director-General, Army Medical Service, a few days preceding the examination. The Director-General will decide if the candidate may be allowed to compete for a commission. If approved, he will then be examined as to his physical fitness by a board of medical officers. The following is the order of the examinations:—

1. A candidate for a commission in the Royal Army Medical Corps must be in good mental and bodily health and free from any physical defect likely to interfere with the efficient performance of military duty.

2. The attention of the board will be directed to the following points: (*a*) That the correlation of age, height, weight, and chest girth is not less than that which is given in the following table:—

Physical Equivalents.

Age.	Height without shoes.	Chest.	
		Girth when expanded.	Range of expansion.
	Inches.		
21 and upwards.	62½ and under 65	35 inches.	2 inches.
	65 " 68	35½ "	2 "
	68 " 70	36 "	2 "
	70 " 72	36½ "	2½ "
	72 and upwards.	37 "	2½ "

(*b*) [illegible] The candidate will be placed against the stand[illegible] and the weight thrown on the heels and [illegible] the feet. He will stand erect without rigidity and with the heels, calves, buttocks, and shoulders touching the standard; the chin will be depressed to bring the vertex of the head level under the horizontal bar and the height will be noted in parts of an inch to eighths.

(*c*) Measurement of chest. The candidate will be made to stand erect with his feet together and to raise his hands above his head. T[illegible] adjusted round the chest with its posterior [illegible] inferior angles of the shoulder blades and its [illegible]per part of the nipples. The arms will then be lowered to hang loosely by the side and care will be taken that the shoulders are not thrown upwards or backwards so as to displace the tape. The maximum expansion during deep inspiration will be carefully noted.

(*d*) Weight. The candidate will also be weighed and his weight recorded in the proceedings of the Board.

(*e*) The regulations regarding the examination of eyesight are as follows:—

1. If a candidate can read D.=6 at 6 metres (20 English feet) and D.=0 6 at any distance selected by himself, with each eye without glasses, he will be considered *fit*.

2. If a candidate can only read D.=24 at 6 metres (20 English feet) with each eye without glasses, his visual deficiency being due to faulty refraction which can be corrected by glasses which enable him to read D.=6 at 6 metres (20 English feet) with one eye, and D.=12, at the same distance with the other eye, and can also read D.=0 8 with each eye without glasses, at any distance selected by himself, he will be considered *fit*.

3. If a candidate can read D.=6 at 6 metres (20 English feet) with one eye, a higher defect than D.=24 will be accepted in the other; and if he can read D=36 with the defective e[illegible] distance, the defect being due to error in refractio[illegible] glasses so that he can read, at least, D.=[illegible]

4. If a candidate cannot read D.=24 [illegible] with each eye without glasses, notwithstanding he can read D.=0 6, he will be considered *unfit*. The candidate must be able to read the tests without hesitation in ordinary daylight. (N.B.—The Army test [illegible] the types and Snellen's test ty[illegible] acuteness of vision.) Squint, [illegible] risk of aggravation or recurren[illegible] of a candidate. Inability to distinguish the principal colours will not be regarded as a cause for rejection, but the fact will be noted in the report, and the candidate will be informed. The degree of acuteness of vision of all candidates for commissions (including preliminary examinations) will be entered in their reports in the following manner:—

Sufficient ... ... { Right eye ... V =
{ Left eye ... V =
Defective ... ... { Right eye ... V =
{ Left eye ... V =

No relaxation of the standard of vision will ever be allowed.

The following additional points will then be observed. (*f*) That his hearing is good. (*g*) That his speech is without impediment. (*h*) That his teeth are in good order. Loss or decay of ten teeth will be considered a disqualification Decayed teeth if well filled will be considered as sound. (*i*) That his chest is well formed and that his heart and lungs are sound. (*j*) That he is not ruptured. (*k*) That he does not suffer from varicocele or varicose veins in a severe degree. A candidate who has been successfully operated on will be accepted. A definition of severe varicocele [illegible] the Director-General Army Medical Service, [illegible] S.W. (*l*) That his limbs are well formed and d[illegible]ere is free and perfect motion of all the joints. (*n*) That his feet and toes are well formed. [illegible] any inveterate skin disease. (*p*) That h[illegible] or defect. (*q*) That he does not bear [illegible]nic disease pointing to an impaired [illegible]e is not of pure European descent the fact should be recorded by the board. If a candidate be pronounced physically fit for service at home and abroad he will be eligible to present himself [illegible] which will be held twice in the yea[illegible]ndidate

The Army Council reserv[illegible] who may show a deficiency i[illegible]tted to

An entrance fee of £1 is required from each candidate [illegible] the examination and is payable at the conclusion of his physical examination, if pronounced fit.

Candidates who have been specially employed in consequence of a national emergency, either as an officer or in a position usually filled by an officer, will be allowed to reckon such service towards retired pay and gratuity, and if over the [illegible] mencement of th [illegible]

for two or more [illegible]

Director [illegible] characte [illegible] Corps, h [illegible] sion will [illegible]

Candidates w [illegible] medicine and surgery. [illegible] practical character, partly written and partly oral, marks being allotted under the following scheme.

Medicine (written).	Maximum marks.
A. Examination and report upon a medical case	125
B. Commentary [illegible]	100
(Two perio [illegible] alf hours—[illegible])	
A. Clinical cases	100
B Medical pathology	75
(Ten minutes to examine case and ten minutes *viva voce*—total, 20 minutes—for A; 30 minutes to examine specimens and ten minutes *viva voce*—total, 40 minutes—for B.)	
Surgery (written).	
A. Examination and report upon a surgical case	100
B. Commentary upon a case in surgery	125
(Two periods of 45 minutes—total, one and a half hours—for A, and one and a half hours for B.)	
Surgery (oral).	
A. Clinical surgery and pathology (including diseases of the eye)	75
B. Operative surgery and bandaging (including surgical instruments and appliances)	100
(Ten minutes to examine case and ten minutes *viva voce*—total, 20 minutes—for A, and about 30 minutes for B.)	
Total marks	800

The following headings are published as a guide to candidates in drawing up their reports on cases:—(a) A brief history of the case as [illegible]

clinical aspects of the case. (c) The diagnosis, with reasons for [illegible] operative, &c., in- [illegible] native schemes of [illegible] appearances and [illegible] and will occupy about four days.

The appointments announced for the competition will be filled up from the list of qualified candidates arranged in the order of merit, as determined by the total number of marks each has obtained. Having gained a place in this entrance examination the successful candidates will be ordered to proceed to the Royal Army Medical College for instruction in recruiting duties, at the termination of which they will undergo two months' instruction in Hygiene, Pathology, Tropical Medicine, Military Surgery, and Military Medical [illegible] ill be examined in these [illegible] of marks obtainable at [illegible] the present time the pro- [illegible] College are Major C. G. Spencer, M.B., F.R.C.S., in the department of military surgery; Lieutenant-Colonel Robert J. S. Simpson, M.B., C.M.G., in the department of military medicine; Lieutenant-Colonel Sir W. B. Leishman, M.B., in the department of [illegible]

of the Royal Army Medical College, instructs in hospital and corps administration, in the duties of officers on transports, and in the examination of recruits, and Brevet-Colonel F. J. Lambkin lectures on Syphilology. The course of hygiene has hitherto comprised the examinations of water and air, the general principles of diet with the quality and adulterations of food and beverages, the sanitary requirements of barracks, hospitals, and camps, the consideration of the clothing, duties, and exercises of the soldier, and the circumstances affecting his health, with the best means of preventing disease, both at home and under the conditions of foreign service, also with particular reference to active service in the field. The pathological course has up to the present time included bacteriology and demonstrations in physiological chemistry, special attention being given to modern methods of research in the causation of tropical disease. The surgical course consists of lectures and demonstrations in military surgery and lectures on errors of refraction from a military point of view. On completion of the above course Lieutenants on probation will join the Royal Army Medical Corps School of Instruction at Aldershot for a two months' course in the technical duties of the corps, and at the end of the course will be examined in the subjects taught. The maximum number of marks obtainable at this examination will be 100. A Lieutenant on probation who fails to qualify in either of these examinations will be allowed a second trial, and, should he qualify, will be placed at the bottom of the list. Should he again fail in either examination his commission will not be confirmed. Illiteracy on the part of a candidate as evinced by inaccurate spelling, poor composition, or grammatical errors in the oral examination, at the entrance examination, or at the examinations undergone while on probation will be regarded as disqualifying for appointment.

EXAMINATIONS FOR PROMOTION IN THE ROYAL ARMY MEDICAL CORPS.

These examinations are intended to test the progress and proficiency of officers in those branches of knowledge which are essential to their continued efficiency.

[illegible] *Captain*.—This examination may be [illegible] ng 18 months' service and will be [illegible] hich the officer is serving. The [illegible] are detailed in the King's Regu- [illegible] company, and corps drills and exercises; [illegible] the terms of the Geneva Convention; (b) a general [illegible] pment of the [illegible] ties of ward- [illegible] eparation of [illegible] (4) duties of [illegible] be examined [illegible] celeration in [illegible] of the Pay [illegible] ill be placed [illegible] acceleration [illegible] re him.

Services of the more important Powers; and (c) the laws and customs of war, so far as they relate to the sick and wounded. 4. A tactical problem in field medical administration.

PAY.

The following shall be the rates of pay, additional pay, and charge pay of the Army Medical Staff and Royal Army Medical Corps, but as the pay warrant is amended from time to time, they are merely quoted for guidance:—

Army Medical Service.	Inclusive of all allowances except field and travelling allowances (yearly).
At Headquarters.	£
Director-General	2000
Deputy Director-General	1500
Assistant Director-General...	850
Deputy Assistant Director-General	750
	Exclusive of allowances (daily).
At Other Stations.	£ s. d.
Surgeon-General	3 0 0
Colonel	2 5 0
Lieutenant-Colonel	1 10 0
Lieutenant-Colonel promoted to the rank after three years as such	1 15 0
Major	1 3 6
After three years as such...	1 6 0
Captain	0 15 6
After seven years' total full-pay service	0 17 0
After ten years' total full pay service	1 1 0
Lieutenant on probation and Lieutenant	0 14 0
Adjutant of the Royal Army Medical Corps (Territorial Force)	The pay of his rank.

A Captain of the Royal Army Medical Corps, holding the brevet rank of Major, shall receive pay at 2*s.* a day, in addition to the rates laid down.

Additional Pay.

[illegible] he Headquarters Staff appointed a member [illegible] 150 a year. An officer under the rank of [illegible] an appointment as specialist, 2*s.* 6*d.* daily.

Charge Pay.

(*a*) An officer in charge of a general or other hospital, or of a division of a general hospital—

	Daily.
	s. *d.*
If in charge of at least 50 beds	2 6
,, ,, 100 ,, ...	5 0
,, ,, 200 ,, ...	7 6
,, ,, 300 ,, ...	10 0
(*b*) Senior medical officer, Royal Arsenal, not exceeding	10 0
(*c*) Officer in command of the Depôt, Royal Army Medical Corps	5 0
(*d*) The Senior officer of the Army Medical Service with an army in the field— A rate to be fixed according to the magnitude of the charge.	
(*e*) In a command abroad— The senior medical officer, if under the substantive rank of colonel, if the number of soldiers is 1500 or upwards	5 0

Reserve of Officers.

An officer of the Royal Army Medical Corps with at least three, but not more than six, years' service may be permitted to become an Army Reserve Officer for a period of seven years, and while so serving he shall receive a retaining fee of £25 a year. With the sanction of the Army Council such officer may be allowed to return to the active list, and if the period he has been in the Reserve of Officers amounts to at least one year, and not more than three years, he shall be allowed to reckon one-third of such period towards promotion, gratuity, and pension.

Seconded Officers.

A Lieutenant on probation who at the time of passing the examination for admission to the Royal Army Medical Corps holds, or is about to hold, a resident appointment in a recognised civil hospital may be seconded for the period not exceeding one year during which he holds the appointment. While seconded he shall not receive pay from army funds, but his service shall reckon towards promotion, increase of pay, gratuity, and pension.

PROMOTION.

No promotion of a medical or departmental officer shall be made without the approval of the Secretary of State.

An officer shall be eligible for promotion to the rank of Captain on the completion of three and a half years' service, and to the rank of Major on the completion of 12 years' service, provided that in each case he has previously qualified in such manner as may be prescribed by the Army Council.

Promotion to the rank of Lieutenant-Colonel to complete an establishment shall be made by selec[illegible] such manner as may be prescri[illegible]

If an officer has passed with [illegible] for promotion to the rank of Major, the period of service required to render him eligible for that rank may be reduced as follows:—

	Months.
If he obtained a "special certificate"	18
,, passed in the 1st Class	12
,, ,, ,, 2nd ,, ...	6
,, ,, ,, 3rd ,, ...	3

Promotion to the rank of Colonel to complete an establishment shall be made by selection from Lieutenant-Colonels. A Lieutenant-Colonel may also be promoted to the rank of Colonel if specially recommended for distinguished service in the field. Promotion to the rank of Surgeon-General shall be made by selection from Colonels. A Colonel may also be promoted to the rank of Surgeon-General for distinguished service in the field. An officer of the Royal Army Medical Corps is eligible for promotion to brevet rank. A Captain after at least 6 years' service, a Major or Lieutenant-Colonel, may be promoted to the next higher rank by brevet for distinguished service in the field or for meritorious or distinguished service of an exceptional nature other than in the field. If the officer dies before the date on which the notification of his promotion for distinguished service in the field appears in the *London Gazette* the promotion shall bear the date which it would have borne had the officer not died. Distinction in original investigation or research may, in the case of officers of the Royal Army Medical Corps, be regarded as "distinguished service of an exceptional nature other than in the field." An officer who may in the opinion of the Army Council have been prevented, in very special circumstances, from qualifying for promotion, or who, having failed to qualify, may have been debarred from further opportunity of qualifying, may be provisionally promoted. If, however, he fails to qualify on the first available opportunity his promotion shall be cancelled and he shall be retired from the service. An officer shall reckon towards his promotion any time, not exceeding one year, during which he may have been on half-pay on account of ill-health caused by military service; and also any time not exceeding two years during which he may have been on half-pay on reduction. An officer while seconded shall continue to be eligible for selection for promotion as if he had remained on the establishment, and his service while seconded shall reckon towards such promotion.

RANK.

The Director-General of the Army Medical Service shall hold the substantive rank of Surgeon-General and shall rank in relation to combatant officers as a Lieutenant General if recommended by the Army Council. All other Surgeon-Generals shall rank as Major-Generals in relation to combatant officers.

RETIREMENT.

(*a*) *Voluntary Retirement.*

An officer of the Army Medical Service will be permitted to retire in cases in which such retirement may be deemed expedient by the Secretary of State.

Scale of Retired Pay.

	Yearly.
	£
Director-General after 3 years' service in the appointment (with 30 years' service)	1125
Under 3 years' service as Director-General and after not less than 30 years' service	875
	Daily.
	£ s. d.
Surgeon-General	2 0 0
Colonel—	
Under 4 years' service as such, but with 30 years' total service	1 10 0
After 4 years' service as such	1 15 0
If not qualified as above	the rate for a lieutenant-colonel.
Surgeon-Lieutenant-Colonel of the Household Troops—	£ s. d.
After 20 years' service	1 0 0
,, 25 ,, ...	1 2 6
,, 30 ,, ...	1 5 0
Lieutenant-Colonel—	
After 20 years' service	1 0 0
,, 25 ,, ...	1 2 6
,, 28 ,, ...	1 7 6
Major, or Surgeon-Major of the Household Troops—	
After 20 years' service	1 0 0
	Gratuity.
	£
Major, or Captain, or Surgeon-Captain of Household Cavalry—	
After 5 years' service in the rank of captain	1000
,, 3 ,, ,, major	1800
,, 6 ,, ,, ,, ...	2500
Surgeon-Lieutenant Colonel or Surgeon-Major of the Household Troops—	
After 15 years' service...	1800
,, 18 ,, ...	2500

Except in the case of a Colonel, or a Lieutenant-Colonel, an officer of the Army Medical Service, who, on voluntary retirement, has served for less than three years in the rank from which he retires, shall be entitled only to the gratuity or retired pay assigned to the next lower rank.

(*b*) *Retirement on Account of Age or Limitation of Period of Service.*

The Director-General of the Army Medical Service shall, unless his service has been specially extended, retire on completion of the term of his appointment, and the retirement of other officers of the Army Medical Service (except Quartermasters) shall be compulsory at the following ages: Surgeon-General, 60; Colonel, 57; and other officers, 55. A Major shall retire on completion of 25 years' service if he has been superseded for promotion; or, if he fails to qualify for promotion, on completion of 20 years' service. It shall be competent to the Secretary of State to place a medical officer on the retired list after 30 years' service.

(*c*) *Retirement on Account of Medical Unfitness.*

An officer placed on the half-pay list on account of medical unfitness shall, if not previously retired, be retired from the Army at the expiration of five years from the date on which he was placed on the half-pay list, or, if reported by the regulated medical authority to be permanently unfit for duty, on the officer's application, at such earlier date as may be decided by the Army Council.

An officer, whether on full pay or half pay, who, to the satisfaction of the regulated medical authority has been pronounced insane, shall be retired from the Army.

The scale of retired pay on account of age or medical unfitness is the same as under voluntary retirement, except that the condition of three years' service in the rank is omitted.

Rates for Officers not qualified for Retired Pay on Voluntary Retirement.

If the unfitness was caused by military service retired pay equal to the half pay of his rank. If not so caused, provided the officer has at least 12 years' service, retired pay equal to the half pay of his rank for such period only, not exceeding five years from the date of the officer's retirement from the Army, after five years on half pay under Article 435, as the Army Council shall determine according to the merits of the case.

KING'S HONORARY PHYSICIANS AND HONORARY SURGEONS.

[illegible] retirement.

MEDICAL OFFICERS OF THE REGIMENTS OF HOUSEHOLD TROOPS.

[illegible]

PROMOTION.

Household Cavalry.

[illegible] a vacancy occurring for such promotion.

A Surgeon-Lieutenant, Surgeon-Captain, or Surgeon-Major of the Household Cavalry may be promoted for distinguished service in the field under the conditions laid down in Article 296.

PAY.

	Daily. £	s.	d.
Surgeon-Lieutenant-Colonel	1	10	0
Surgeon-Major	1	3	6
After three years' service as such	1	6	0
Surgeon-Captain...	0	15	6
After seven years' service	0	17	0
After ten years' service	1	1	0
Surgeon Lieutenant	0	14	0

PROMOTION.

A medical officer of the Household Troops shall be eligible for extra pay under the provisions of Articles 319 and 320.

GENERAL REGULATIONS.

In all matters not provided for by Articles 329 to 334 and 547 to 552 the medical officers of the Household Troops shall be governed by the general regulations for regimental officers of the army.

EXCHANGES AND TRANSFERS.

An officer of the Royal Army Medical Corps shall be permitted to exchange with another officer of such corps, or with a medical officer of the Household Troops, under such conditions and regulations as [illegible] placed for seniority next below [illegible] ave the same date as his own; [illegible] laced for seniority below all [illegible] the time of his transfer and [illegible] next above him has been promoted.

An officer of the Royal Army Medical Corps who has exchanged or been transferred from the Indian Army shall reckon, subject to the conditions of Article 316, his previous service with the said forces towards promotion, increase of pay, gratuity, and pension.

LEAVE OF ABSENCE.

[illegible] exhausted or exceeded in consequence of sickness no further pay during ordinary leave shall remain due.

SICK LEAVE.

An officer of the Army Medical Service may be allowed full pay [illegible] on the same conditions as those laid down [illegible] shall not be included in the period of absence on leave to which the issue of pay is limited by Article 423, provided the general officer commanding at the station considers that the circumstances of the case warrant such a concession. Any excess of such leave of absence on account of sickness at an officer's station beyond the period of 30 days shall come under the provisions of Article 425.

SERVICE ON THE WEST COAST OF AFRICA.

An officer volunteering for, or ordered to, the West Coast of Africa [illegible] it, and for [illegible] ve, or on [illegible] the West [illegible] for every [illegible]

WIDOWS' PENSIONS.

Widows' pensions and compassionate allowances for children and other relatives of deceased officer [illegible] specified in the Royal Warrant for [illegible] an Army Medical Officers' Widows' [illegible] assurance principles.

PAY IN INDIA.

There has been an improvement of late years in the pay and conditions of service of army medical officers in India, as elsewhere. The pay of a lieutenant is 420 rupees per mensem, but it is rarely, if ever, that a medical officer proceeds to India until he has attained captain's rank, the pay is then from 475 rupees to commence with, increasing to 530 rupees after seven, and to 650 rupees after ten years' service. Majors receive 789 rupees on promotion and 826 rupees after 15 years' service. Lieutenant-Colonels, 1150 rupees. In addition, charge pay is given, ranging from 60 to 240 rupees according to the size of the hospital. There are also various specialist appointments, carrying extra pay, that are shared between the Royal Army Medical Corps and the Indian Medical Service. It may be said that a bachelor can live quite comfortably on 500 rupees and a married man on 700 to 800 rupees. The purchasing power of the rupee is not what it was 20 years ago, but, on the other hand, many of the ordinary necessities of life are in India cheaper than at home.

INDIAN MEDICAL SERVICE.

The grades of officers in the Indian Medical Service are the same as those of the Army Medical Service and Royal Army Medical Corps. The Director-General will rank either as Major-General or Lieutenant-General as may be decided in each case by the Secretary of State for India in Council.

REGULATIONS FOR THE EXAMINATION OF CANDIDATES FOR ADMISSION TO THE INDIAN MEDICAL SERVICE.

Candidates must be natural born subjects of His Majesty, of European or East Indian descent, between 21 and 28 years of age at the date of the examination, of sound bodily health, and in the opinion of the Secretary of State for India in Council in all respects suitable to hold commissions in the Indian Medical Service. They [illegible] Secretary, India [illegible] date fixed in the [illegible] ccording to the annexed form.

Declaration and Schedule of Qualifications to be Filled up by Candidates.

1. Name in full... ... ...
2. Address. (*Any alteration to be notified to the Military Secretary,* [illegible] ....
3. [illegible] ....
4. Profession or occupation of father, and whether, at the time of candidate's birth, his father was a British subject of European or East Indian descent... ... ...
5. Statement as to whether the candidate is married or single ... .
6. Colleges and Medical Schools at which the candidate has received his medical education ... ...

7. Medical School in which the candidate completed his course as a medical student, and name of the Dean or other responsible authority ... ...
8. Degrees of B.A. or M.A.; details as to any prizes, university honours, &c. ... ...
9. Registrable qualifications ... ...
10. Date of examination at which the candidate proposes to present himself ... ...
11. Date of any previous occasions on which the candidate may have presented himself for examination for admission to the Indian Medical Service, or other examination for the Public Services... ... ...
12. Particulars of any commission or appointment held in the Public Services... ... ...

I, ..., a candidate for employment in His Majesty's Indian Medical Service, do hereby attest my readiness to engage for that service, and to proceed on duty immediately on being gazetted.

I declare that I labour under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer.

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief.

I inclose, in accordance with Paragraph 4 of the Regulations, (*a*) proof of age; (*b*) two certificates of character; (*c*) certificate of having attended a course of ophthalmic instruction, showing that the course included instruction in errors of refraction; (*d*) evidence of a registrable qualification; (*e*) *in case of natives of India or others educated in that country only*, a certificate from the Director-General, Indian Medical Service

Signature ....
Date ...., 19 .

Candidates for the Indian Medical Service may, if they like, undergo a preliminary examination by the Medical Board which meets at the India Office every Tuesday by applying to the Under Secretary of State, India Office, inclosing a fee of two guineas. They must pay their own travelling expenses. The decision must be understood, however, not to be final. It may be reversed in either direction by the Examining Medical Board immediately prior to the Professional Examination.

The declaration must be accompanied by the following documents:—*a*. *Proof of age* either by Registrar-General's certificate, or, where such certificate is unattainable, by the candidate's own statutory declaration, form for which can be obtained at the India Office, supported, if required by the Secretary of State, by such evidence as he may consider satisfactory. A certificate of baptism which does not afford proof of age will be useless. *b* A recommendation and certificate of moral character from two responsible persons—not members of his own family—to the effect that he is of regular and steady habits and likely in every respect to prove creditable to the service if admitted. *c*. A certificate of having attended a course of instruction *for not less than three months at an ophthalmic hospital or the ophthalmic department of a general hospital*, which course shall include instruction in the errors of refraction. *d*. Some evidence of having obtained a registrable qualification. *e*. Any European educated in India and every native of that country will be required to produce a certificate signed by the Director-General, Indian Medical Service, that he is a suitable person to hold a commission in the Indian Medical Service.

The Secretary of State for India reserves the right of deciding whether the candidate may be allowed to compete for a commission in His Majesty's Indian Medical Service

The physical fitness of each candidate will be determined by a Board of Medical Officers who are required to certify that his vision is sufficiently good to enable him to pass the tests laid down by the regulations. Every candidate must also be free from all organic disease and from constitutional weakness or other disability likely to unfit him for military service in India. The standard of eyesight is the same as for the Royal Army Medical Corps (omitting the third regulation, but with the addition that inability to distinguish the principal colours may cause rejection) and the physical examination is in all respects the same (see under Royal Army Medical Corps). Candidates who pass the physical examination will be required to pay a fee of £1 before being permitted to compete. No candidate will be permitted to compete more than three times. More detailed regulations as to the physical requirements can be obtained on application to the India Office. Candidates may, if they wish, have a preliminary medical examination at the India Office on application and payment of 2 guineas.

On proving possession of the foregoing qualifications the candidate will be examined by the Examining Board in the following subjects and the highest number of marks attainable will be distributed as follows:—

	Marks.
1. Medicine, including therapeutics...	1200
2. Surgery, including diseases of the eye	1200
3. Applied anatomy and physiology...	600
4. Pathology and bacteriology	900
5. Midwifery and diseases of women and children	600
6. Materia medica, pharmacology, and toxicology	600

N.B.—The examination in medicine and surgery will be in part practical and will include operations on the dead body, the application of surgical apparatus, and the examination of medical and surgical patients at the bedside. No syllabus is issued in the subjects of pharmacology and toxicology, but the examination will be conducted so as to test the general knowledge of the candidate. No candidate shall be considered eligible who shall not have obtained at least *one third* of the marks obtainable in each of the above subjects and *one half* of the aggregate marks for all the subjects.

For the clinical examinations each candidate should provide himself with notebook, pencil, stethoscope, and ophthalmoscope. In drawing up reports on cases the following points should be observed, viz.: (*a*) A brief history of the case as given by patient, including such points in the family or personal history as have a distinct bearing on patient's case. (*b*) A detailed account of [illegible] signs elicited by the candidate's [illegible] noting the absence of any which [illegible] similar case. (*c*) Where there is [illegible] the candidate as to the exact d[illegible] with his reasons for making th[illegible] the case as a whole, pointing out the symptoms which may be considered typical and those which appear to be unusual or only accidental complications. (*e*) Suggestions as to treatment, both immediate and possibly necessary at a later date. (*f*) A forecast of the progress and probable termination of the case.

After passing this examination the [illegible] granted about a month's leave and will t[illegible] successive courses of two months each [illegible] Army Medical College, Millbank.

The course at Aldershot will include instruction in (1) internal economy, (2) Indian military law, (3) hospital administration, (4) st[illegible] p reading. [illegible] in (1) hygiene, (2[illegible], and (4) pathology of diseases and injuries incidental to military and tropical service.

From the day on which the result of the examination is announced lieutenants-on-probation will receive an allowance of 14*s.* per diem, with quarters (where quarters are not provided, with the usual allowances of a subaltern in lieu thereof), to cover all costs of maintenance, and he will be required to provide himself with uniform (viz., the regulation undress uniform and mess dress of a *Lieutenant of the Indian Medical Service*, as described in Indian Army Regulations, Vol. VII., with Sam Browne belt).

A lieutenant-on-probation who is granted sick leave before the completion of his course of instruction and final admission to the service will receive pay at the rate of 10*s.* 6*d.* a day for the period of his sick leave.

Candidates will be required to conform to such rules of discipline as may from time to time be laid down.

At the conclusion of the course candidates will be required to pass an examination on the subjects taught during the course of instruction. No candidate may compete more than three times. Candidates will be supplied, on application, with copies of the papers set at the last examination preceding.

Officers appointed to the Indian Medical Service will be placed on one list, their position on it being determined by the combined results of the preliminary and final examinations. They will be liable for military employment in any part of India, but in view to future transfers to civil employment, they will stand posted to one of the following civil areas:—(1) Madras and Burma; (2) Bombay with Aden; (3) Upper Provinces—i.e., United Provinces, Punjab, and Central Provinces; and (4) Lower Provinces—i.e., Bengal, and Eastern Bengal and Assam. The allocation of officers [illegible] of employment will be determined upon a consideration [illegible] as far as possible, the candidate's ow[illegible] civil employment, though ordinar[illegible] which they may have been assigned, [illegible] elsewhere according to the exigencies of the service.

At the close of the session those lieutenants-on-probation who have obtained one-third of the possible total of marks and have satisfied the authorities that they possess the necessary skill, knowledge, and character for permanent appointment are recommended for commissions as Lieutenants in the Indian Medical Service.[4]

---

[3] In our opinion as long as [illegible] of the Indian Medical Service receive [illegible] ege, the post of Professor of Medicine i[illegible] by a distinguished officer of the Indian [illegible] n officer of the Royal Army Medical Corps who may have had no training as a teacher nor possess any special knowledge of tropical diseases. The lectures on Military Medicine treat of tropical and other diseases to which soldiers are exposed in the course of their service, the mortality and invaliding by disease, in peace and war, at home and abroad, the management of lunatics under the conditions of military service, &c. The lieutenants on-probation of both services attend Queen Alexandra's Military Hospital, Millbank, where they are taught practically the details of the management of patients in a military hospital, and the registration of their diseases, the duties of invaliding, the modes of filling up the regulation statistical returns, and other service documents. No provision for instruction in lunacy has as yet been made in London. While in London the [illegible] both services reside at the R.A.M. College [illegible] ate's commission as lieutenant will bear th[illegible] the examination is announced, but his rank will not be gazetted until he has passed the final examination.

[4] A lieutenant who, within a reasonable period before the date at [illegible] proof of his election [illegible] ital, may be seconded [illegible] e on which he takes [illegible] within three months of passing his final examination and that he holds himself in readiness to sail for India within 14 days of the termination of the appointment. While seconded he will receive no pay from Indian funds, but his service towards promotion, increase of pay, and pension will reckon from the date borne on his commission. In special cases permission may be granted to lieu[illegible] for India, in order to sit for some fur[illegible] ing in England under s[illegible] period beyond two mon[illegible] Medical College unless [illegible] majority of the [illegible] two months, in [illegible] receive pay up t[illegible] day of embarkation for India. possible, provided with
when such accommoda-
e public expense is pro-
vided by steamer, or a passage allowance granted if pre ferred. A charge for messing during the voyage is made at the rate of 2s. a day. This payment does not include the cost of liquors, which are charged for as extras. Any officer who may neglect or refuse to proceed to India under the orders of the Secretary of State for India within two months from the date of terminating his course of instruction, or within 14 days of the termination of his hospital appointment if the Secretary of State has permitted him to hold one, will be considered as having forfeited his commission unless special circumstances shall justify a departure from this regulation.

A course of instruction in sanitary methods, rules, and regulations as carried out in Indian cantonments has recently been instituted for young officers of the Indian Medical Service and the Royal Army Medical Corps on first arrival in the country. The nature of the diseases to be combated, the social and religious customs and prejudices of the various races, and the limited resources of money and material make large modifications from European methods necessary. Lieutenants of both services are now posted on arrival either to Rawal Pindi, Poona, Lucknow, or Bangalore for one month for this course, which is carried out under the supervision of the senior medical officer and sanitary officer. The instructors are medical officers nominated by the principal medical officer, India, and demonstrations on various subjects are given by other officers, staff, engineer, and medical. The course consists of demonstrations and inspections in all parts of the lines of British and Indian troops, bazaars, Government dairies, bakeries, slaughter-houses, trade premises of dairymen, bakers, butchers, and aerated water manufacturers and dhobies' houses, market and water-supplies, methods of washing clothes, surface drainage, removal and disposal of sewage and refuse, antimalarial measures, disinfection, cantonment hospitals, control of venereal diseases, plague prevention, methods of hospital administration, &c. The officers under instruction thus have an opportunity of learning something of native customs and are encouraged to learn the vernacular, so as to be less dependent upon their subordinates when first put in responsible positions.

A Lieutenant may be promoted to the rank of Captain on completing three years' full-pay service from the date of first commission, but after completing 18 months' service and before promotion to the rank of Captain he will be required to pass an examination in military law and military medic organisation, the result of which may affect his pron tion. Captains are promoted to the rank of Major after years' full-pay service, but this promotion is accelerated six months in the case of officers who fulfil certain specifi conditions. A Major is promoted to Lieutenant-Colonel completion of of eight years' full-pay service in the ra of Major. All promotions to higher grades are given selection for ability and merit. In case of distinguish service a medical officer may receive special promotic The ages for compulsory retirement are the same as those for the Royal Army Medical Corps. Officers of the Indian Medical Service below the rank of Colonel may be granted: 1. Privilege leave under such regulations as may from time to time be in force. 2. Leave out of India for no longer period than one year, capable of extension to two years' absence from duty, on the following pay for officers in military employment (officers in civil employment are entitled to higher rates):—After arrival in India, on first appointment, £250 a year; after the commencement of the *tenth year's service* for pension, £300 a year; after the commencement of the fifteenth year's service for pension, £450 a year; after the commencement of the twentieth year's service for pension, £600 a year; and after the commencement of the twenty-fifth year's service for pension, £700 a year. 3. Leave in India, but for the period of one year only, on full military pay and half the staff salary of appointment. No extension of leave involving absence from duty for more than two years, whether taken in or out of India, can be granted except on specially urgent grounds and without pay. An officer unable on account of the state of his health to return to duty within the maximum period of two years' absence, unless he is specially granted an extension of leave without pay, is placed on *temporary* half-pay or the retired list, as the circumstances of the case may require. An officer is also liable to be placed on half-pay or the retired list should his health require an undue amount of leave, whether in or out of India. Leave may be granted at any time, but solely at the discretion of the civil or military authorities in India under whom an officer may be serving. *Officers of the Administrative grades* may be granted one period of leave not exceeding eight months during their tenure of appointment. Extra furlough may be granted to officers desirous of pursuing special courses of study at the rate of one month's furlough for each year's service up to 12 months in all. During such leave the ordinary furlough pay will be given with lodging allowances of 4s., 6s., and 8s. a day for Lieutenants, Captains, and field officers respectively. An officer on leave is required to join at once on being recalled to duty unless certified by a medical board as unfit to do so.

POSTS IN CIVIL EMPLOY.

A large number of posts in civil employ are ordinarily filled up from officers of the Indian Medical Service. Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment. The principal appointments, together with the salaries attached to each, are stated in the following table:—

Description of appointment.	Approximate number of appointments in each class.	Salary per mensem. When held by a Lieutenant-Colonel.	When held by a Major.	When held by a Captain.	When held by a Lieutenant.
		Rs.	Rs.	Rs.	Rs.

Deputy Sanitary Commissioners...	13	1350-1500	900-1000	650-800	600
Bacteriological Appointments	5	1500-1600	1050-1150	700-900	650
Superintendents of Central Lunatic Asylums	6	1400-1550	1050-1150	700-900	650
Superintendents of First Class Central Jails	5	1400-1550	950-1050	700-850	650
Superintendents of Second Class Central Jails	5	1300-1450	850-950	600-750	550
Civil Surgeoncies (First Class)	37	1300-1450	850-950	600-750	550
Civil Surgeoncies (Second Class)	171	1200-1350	750-850	500-650	450
Probationary Chemical Examiner	1	—	—	600-750	550
Officers deputed to plague duty		1450	1000-1100	750-900	700

An allowance of Rs. 100 per mensem is also granted, in addition, to the chief plague medical officers in certain provinces.

There are also six Chemical Examiners with Rs. 800-1650 per mensem and a number of Port Health Officers with Rs. 750-1950 *per mensem*. Other appointments of Resident Surgeons and Physicians at hospitals, &c., are on salaries ranging from Rs. 700 to 1650 per mensem. There are also a certain number of appointments under the Political Department on salaries ranging from Rs. 450 to 1450 per mensem, exclusive of local allowances.

Qualified officers of the Medical Service are also eligible for appointments in the Assay and Mint Departments. The salaries of these appointments are from Rs. 600-2250 per mensem.

TENURE OF OFFICE IN ADMINISTRATIVE GRADES.

The tenure of office of Surgeon-Generals and Colonels is limited to five years. Colonels, if not disqualified by age, are eligible either for employment for a second tour of duty in the same grade or for employment in the higher grade of Surgeon-General by *promotion thereto*.

Absence on leave in excess of eight months during a five years' tour of duty involves forfeiture of appointment.

Surgeon-Generals and Colonels, on vacating office at the expiration of the five years' tour of duty, are permitted to draw *in India* an unemployed salary of Rs. 1350 per mensem in the former, and Rs. 1000 in the latter case, for a period of six months from the date of their vacating office, after which they are placed while unemployed on the following scale of pay:—

—	Surgeon-General. Per diem.	Colonel. Per diem.
	£ s. d.	£ s. d.
After 30 years' service on full pay	2 5 0	1 14 0
" 25 " " "	2 5 0	1 10 0
" 20 " " " or on promotion, should this period of service not be completed...	2 0 0	1 8 0

A Surgeon-General or Colonel who has completed his term of service and has reverted to British pay may reside in Europe, at the same time qualifying for higher pension.

RETIRING PENSIONS AND HALF-PAY.

Officers of the Indian Medical Service will be allowed to retire on the following scale of pension on completion of the required periods of service:—

After 30 years' service for pension...	£700 per annum + £350 after three years' active employment in India as a Surgeon-General, or + £250 per annum after five [illegible] absence on leave is allowed to count towards actual service in those grades.
" 27½ " " "	£600 per annum.
" 25 " " "	£500 "
" 20 " " "	£400 "
" 17 " " "	£300 "

Service for pension reckons from date of first commission and includes all leave taken under the leave rules.

Time (not exceeding one year) passed on temporary half-pay reckons as service for promotion and pension, in the case of an officer placed on half-pay on account of medical unfitness caused by duty, military or civil.

Officers of the Indian Medical Service are liable after retirement on pension before completing 30 years' service to recall to military duty in case of any great emergency arising up to 55 years of age.

All officers of the rank of Lieutenant-Colonel and Major are placed on the retired list at the age of 55, and all Surgeons-General and Colonels at the age of 60, but the Director-General is allowed to serve until he has attained the age of 62 years. If a Lieutenant-Colonel has been especially selected for increased pay and he attains the age of 55 years before he becomes entitled to the pension of 30 years' service he may be retained until the completion of such service, and in any special case, where it would appear to be for the good of the Service that an officer should continue in employment, he *may be so continued*, subject in each case to the sanction of the Secretary of State for India in Council.

Officers placed on temporary or permanent half-pay are granted half-pay at the following rates.

—	Rates of Half-pay.* Per diem.	Per annum.
	£ s. d.	£ s. d.
Under 5 years' service	0 6 0	109 10 0
After 5 "	0 8 0	146 0 0
" 10 "	0 10 0	182 10 0
" 15 "	0 13 6	246 7 6
Lieutenant-Colonel, under 3 years' service as such	1 0 0	365 0 0
Lieutenant-Colonel, over 3 years' service as such	1 7 6	501 17 6

* Officers cannot retire *in India* on half-pay.

An officer of less than three years' service, although he may be transferred to the half-pay list under the general conditions of transfer, will not be granted any half-pay unless his unfitness has been caused by service.

INVALID PENSIONS

An officer who has become incapacitated for further service in India on account of unfitness caused by duty may, after he has been two years on temporary half-pay, be granted an Invalid Pension on the following scale:—

	Per annum.
After 16 years' pension service	£272
" 15 " " "	252
" 14 " " "	232
" 13 " " "	212
" 12 " " "	192

WOUND PENSIONS.

Officers are entitled to the same allowances on account of wounds received in action and injuries sustained through the performance of military duty as are granted to combatant officers of His Majesty's Indian Military Forces holding the corresponding military rank.

FAMILY PENSIONS.

The claims to pension of widows and families of officers are treated under the *provisions of* such *Royal Warrant* regulating the grant of pensions to the widows and families of British officers as may be in force at the time being.

The widows and families of officers are also entitled to pensions under the Indian Service Family Pension Regulations, for the benefits of which all officers must, as a condition of their appointment, subscribe from the date of their arrival in India, except in the case of natives of India, for whom it is optional.

HONOURS AND REWARDS.

Officers of the Indian Medical Service are eligible for the military distinction of the Order of the Bath and for other Orders, British and Indian, and for good service pensions. Six of the most meritorious officers are named Honorary Physicians and six are named Honorary Surgeons to His Majesty. On appointment *as Honorary* Physician or Surgeon an officer below the rank of Colonel is promoted to that rank, remaining supernumerary until absorbed.

The Royal Army Medical Corps is at the present time, we believe, a contented service, though the Director-General A.M.S. is excluded from the Army Council, before which he will, however, be summoned whenever his advice and specialist knowledge are required. The relationship of the Director-General to the War Council should be direct and personal. The limitation of the number *of* lieutenant-colonels has, of course, affected adversely some officers who are well worthy of promotion to the highest ranks, and we look to the Director-General to arrange that really deserving officers may not suffer through the introduction of a regulation which would rob the service of officers who have done some of the best work for the Royal Army Medical Corps.

The improvements that have been introduced within the last few years have, however, been so substantial, both as regards emolument and as affecting the professional and military status of medical officers, that it would be ungracious to refrain from acknowledging the generous spirit that has actuated the War Department authorities in their attitude to the medical service. We feel sure that the good results of this are being, and will continue to be, manifested in an improvement in the health and efficiency of the army at large.

In the Indian Medical Service the introduction last year of the increased pension (£600 per annum) after 27½ years' service was an important concession; there is still, however, a block in promotion, administrative rank, which used to come after 26 or 27 years', being now generally deferred until over 30 years' service; limitation of the period of service in administrative rank (as in the army generally) would probably be an improvement. The order that an officer of the Indian Medical Service must refer the question of his fees when above a certain low limit to the civil authority is most objectionable: it might necessitate the violation of professional secrecy and it is professionally degrading. The neglect of the rule that the office of principal medical officer to His Majesty's forces may be held by an officer of the Indian Medical Service is also felt to be a grievance. On the whole it can hardly be said that the Indian service at the present time offers the advantages over the Royal Army Medical Corps, either professional or pecuniary, that it formerly possessed. If the changes foreshadowed in the recent minute of the Secretary of State (see THE LANCET, May 29th, 1909, p. 1537, and July 10th, 1909, p. 91) be carried out, it seems to be inevitable that the status, prospects, and influence of the Indian Medical Service will be affected injuriously. The objections to these proposals are, however, we venture to think, so serious on the grounds of general policy that we abstain from any criticism on their effect on the prospects of the Indian Medical Service; there is, indeed, no concrete proposal to criticise. It is, however, a dangerous thing to introduce a feeling of distrust and uncertainty into any public service; if the duties hitherto performed by the Indian Medical Service are in future to be shared with other medical men not of that service, then the privileges and emoluments of the Indian Medical Service will inevitably be diminished, with the natural result that men of the highest class will come forward in fewer numbers to compete for the service, and the service generally will deteriorate. Such a result would be disastrous.

PUBLIC HEALTH AND TROPICAL MEDICINE.

INSTRUCTION FOR DIPLOMAS IN STATE MEDICINE.

THE following resolutions, designed with a view of ensuring "the possession of a distinctively high proficiency, scientific and practical, in all the branches of study which concern the public health," were adopted by the General Medical Council from 1902 to 1905. The regulations require that—"(1) A period of not less than twelve months shall elapse between the attainment of a registrable qualification in Medicine, Surgery, and Midwifery and the admission of the candidate to any examination or any part thereof for a diploma in Sanitary Science, Public Health or State Medicine; (2) every candidate shall produce evidence of having attended, after obtaining a registrable qualification, during a period of six months, practical instruction in a laboratory, British or foreign, approved of by the body granting the diploma and in which chemistry, bacteriology, and the pathology of diseases of animals transmissible to man are taught; (3) every candidate shall produce evidence that, after having obtained a [illegible]trable qualification, he has for six months (of whic[illegible] least three months shall be distinct and separate fro[illegible] period of laboratory instruction) practically studied the duties, routine and special, of Public Health administration either under a whole-time medical officer of health or a medical officer of health who is also a teacher in public health in a recognised school, or in England and Wales under the medical officer of health of a county or of a single sanitary district of 50,000, or in one or more districts of 30,000 in Scotland or Ireland, or under a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps, district, or command recognised by the General Medical Council, provided that the six months may be reduced to three if a candidate produces evidence that after obtaining a registrable qualification he has for three months attended a course of recognised instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on Public Health administration; (4) every candidate shall produce evidence that after having obtained a registrable qualification he has attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration; (5) the examination shall have been conducted by examiners specially qualified, and shall comprise laboratory work as well as written and oral examination; (6) the rules as to study shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890." It was enacted by Section 18 (2) of the Local Government Act [England and Wales], 1888, that after Jan. 1st, 1892, no such appointment (that of medical officer of health) may be made in any county, or in any district or combination of districts with a population of 50,000 or upwards, unless the officer—having, of course, qualifications in Medicine, Surgery, and Midwifery—is registered as the holder of a diploma in Sanitary Science, Public Health, or State Medicine under Section 21 of the Medical Act, 1886, or has during any three consecutive years preceding 1892 been medical officer of a district or combination of districts with a population of 20,000 at least, or has for three years previously to August 13th, 1888, been a medical officer or inspector of the Local Government Board. With the sanction of the Local Government Board the same person may be appointed medical officer for two or more districts.

The regulations in question as to study may be procured at the office of the General Medical Council in London.

University of London.—Sanitary Science is included under the head of State Medicine in the M.D. degree, and a certificate has to be produced showing that a course of practical instruction has been attended for the prescribed period, and that the course has included such chemical, microscopical, and meteorological work and exercises as more especially relate to sanitation. The attendance includes six months' practical instruction in a laboratory and six months' instruction in public health administration under the supervision of a medical officer of health, and three months' attendance on the practice of a hospital for infectious diseases.

University of Oxford.—An examination, conducted partly in writing, partly *vivâ voce*, and in each subject partly practical, is held in Michaelmas Term in the following subjects:—General Hygiene, General Pathology (with special relation to Infectious Diseases), the Laws relating to Public Health, Sanitary Engineering, Vital Statistics. The examination is in two parts, which may be taken together or separately; but Part I. must be passed either before or at the same examination as Part II. The fee for admission to the examination is £5 for each part. Successful candidates are entitled to receive the Diploma in Public Health. Any person whose name is on the Medical Register is admissible as a candidate for this examination provided (1) a period of not less than twelve months shall have elapsed between the attainment of registrable qualification and the time when he presents himself for either part of the examination; (2) he produce evidence of having, after obtaining a registrable qualification, attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration; (3) he produce evidence of having, after obtaining a registrable qualification, attended during a period of six months on one or more [illegible] approved by the Syndicate, of practical laboratory [illegible]y, Bacteriology, and the Pathology of [illegible]ls that are transmissible to man; and

London Hospital Medical College; St. Bartholomew's Hospital Medical College; King's College, London; University College, London; the Royal Army Medical College, London; the Victoria University of Manchester; the University of Durham Medical School, Newcastle-on-Tyne; University of Birmingham; University of Liverpool; St. Mary's Hospital Medical College; Charing Cross Hospital College; Westminster Hospital Medical School; University College, Bristol; the University of Leeds; Guy's Hospital Medical School; St. Mungo's College, Glasgow; Edinburgh University; Middlesex Hospital Medical School; Royal Southern Hospital, Liverpool; Royal Colleges, Edinburgh; Surgeons' Hall, Edinburgh; Trinity College, Dublin; Queen's College, Belfast; St. Thomas's Hospital Medical School; University College, Cardiff; University College, Sheffield; Medical School, Catholic University, Dublin; St. George's Hospital Medical School; University of Glasgow; University of Aberdeen; Anderson's College, Glasgow; the Royal Institute of Public Health; the Royal College of Surgeons in Ireland; the Government Bacteriological Laboratory, Hong-Kong; and North-East London Post-Graduate College.

University of Durham.—Sanitary Science is the special object of the degrees in Hygiene. Candidates for the degree of Bachelor in Hygiene (B.Hy.) must be at least twenty-two years of age, registered, and a graduate in Medicine of a recognised university, and at least twelve months shall have elapsed after the date when the candidates obtained their first registrable qualification in Medicine, Surgery, and Midwifery before presenting themselves for examination. They shall spend six months at Newcastle-upon-Tyne studying Comparative Pathology, Practical Bacteriology, Outdoor Sanitary Work, Infectious Diseases, Sanitary Chemistry, and Physics. They have to pass an examination in Sanitary Chemistry, Physics, Comparative Pathology, Sanitary Legislation, Vital Statistics, Nosology, Climatology, Meteorology, Distribution of Health and Disease, Sanitary Medicine and Practical Hygiene. The fee for the examination for the degree of B.Hy. is 10 guineas and for the degree £6 6*s*. The examination is divided into two parts and candidates may present themselves for either part or both together at their option. Candidates for the degree of Doctor of Hygiene (D.Hy.) must have acquired the degree of Bachelor in Hygiene, must for two years subsequently have been engaged in practice as a medical officer of health, and must write an essay upon some practical hygienic subject. The fee for the examination for the degree of D.Hy. is £5 and for the degree £6 6*s*. The regulation for education and examination for the Diploma in Public Health (D.P.H.) are the same as those for the degree of Bachelor of Hygiene, except that the candidate is not required to be a graduate in Medicine of a recognised University and the course of study need not be passed at Newcastle-upon-Tyne. The fee for the examination and Diploma in Public Health is 10 guineas.

Victoria University of Manchester.—An examination in Public Health is held twice yearly under the following regulations: The examination is in two parts and is written, oral, and practical. Candidates before entering for either part of the examination must have held for not less than twelve months a registrable qualification in Medicine, Surgery, and Midwifery, and must present satisfactory certificates of having attended courses of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; of having attended, after obtaining a registrable qualification, during at least six months, practical instruction in a laboratory approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those diseases of animals which are communicable from animals to man; of having, after obtaining a registrable qualification, attended for three months the clinical practice of an approved hospital for infectious diseases; of having, after obtaining a registrable qualification, practically studied the duties of outdoor sanitary work for not less than six months under the medical officer of health of a county or of a large urban district. Candidates may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be admitted to Part II. unless he has already passed in Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. The fee for each part is £5 5*s*. and must be paid on or before July 1st in each year. For any subsequent examination in the same part the fee will be £3 3*s*. Every candidate who has passed both parts of the examination to the satisfaction of the examiners, and who is legally registered, will receive a Diploma in Public Health. The examinations will begin about the end of March and the middle of July in each year.

University of Birmingham.—The University grants a degree of B.Sc. in Public Health and also a Diploma in the same subject on the following conditions: Graduates in Medicine of this University may become candidates for the degree of Bachelor of Science in Public Health, by conforming to all the requirements laid down for candidates for the Diploma in Public Health, except that after graduating in Medicine all courses of study must be taken out in the University and they must, in addition, have attended a three months' course of Geology in the University. The following are the regulations for Diploma in Public Health (general conditions):—1. All candidates must be registered under the Medical Act. 2. The examinations will be held in the months of March and June and will consist of two parts. No candidate will be allowed to pass Part II. until he has passed Part I. 3. Candidates may enter for Parts I. and II. separately or at the same time. 4. The examination in each part will be written, oral, and practical. 5. Candidates intending to present themselves for either part of the examination must give notice in writing to the registrar of the University on the date prescribed in the calendar. 6. The fee for each part of the examination is £5. The conditions of admission to the examinations are identical with those recently approved by the General Medical Council.

Officers of the Royal Army Medical Corps who have studied Chemistry and Bacteriology at the Staff College and pursued the further course of study approved by the General Medical Council in December, 1902, will be admitted to the Examination for the Diploma in Public Health, whether they have previously been students of the Birmingham School or not.

University of Liverpool.—The University grants a Diploma in Public Health and every facility is afforded for training in Sanitary Science and State Medicine. The curriculum for the D.P.H. Examination demands (1) a six months' course of practical instruction in Sanitary Science; (2) a six months' course of laboratory instruction in Chemistry and Bacteriology; and (3) practical instruction in Infectious Diseases. Fees.—Chemistry, £5 5*s*.; Bacteriology, £5 5*s*.; Practical Sanitation, £15; Infectious Diseases, £3 3*s*. The courses may be taken out at any time and students are allowed to work daily in the laboratories.

University of Leeds.—The University grants a Diploma in Public Health and every facility is afforded for training in Sanitary Science and State Medicine. The examination, which is held twice in each year—namely, in July and December—is in two parts, and is written, oral, and practical. Candidates, before entering for the first part of the examination, must have held for not less than 12 months a registrable qualification in Medicine, Surgery, and Midwifery and must present satisfactory certificates (1) of having attended an approved course of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; (2) of having attended, after obtaining a registrable qualification, during at least six months practical instruction in laboratories approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those diseases of animals which are communicable from animals to man. Candidates before entering the second part of the examination must present certificates (3) of having, after obtaining a registrable qualification, attended during not less than three months the clinical and administrative practice of a hospital for infectious diseases approved by the University; (4) of having, after obtaining a registrable qualification, during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction required under 2), been diligently engaged in acquiring a knowledge of the duties, routine and special, of Public Health administration under the supervision of (*a*) the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000, or (*b*) a medical officer of health devoting his whole time to Public Health work, or (*c*) a medical officer of health who is also a teacher in the Department of Public Health of a recognised medical school, or (*d*) a sanitary staff officer of the Royal Army Medical Corps having charge of an Army Corps, district, or command recognised for the purpose by the General Medical Council, *or* of having attended during three months as required [illegible] g a registrable [illegible] rses of instruc- [illegible] ts bearing on [illegible] may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be allowed to pass in Part II. unless he has already passed in Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. Fees—The fee for each part is £5 5*s*., and must be paid at least 14 days before the commencement of the examination. For any subsequent examination in the same part the fee will be £3 3*s*. Every candidate who has passed both parts of the examination and [illegible] will receive a Diploma in Public Heal[illegible] registered or entitled to be regis[illegible] 1890, may be exempted from producing the above required certificates of study.

University of Sheffield.—This University grants a Diploma in Public Health and courses of instruction have been arranged for it. These qualify for the Cambridge University Diploma, for that given by the Conjoint Board of England, and for the degree of M.D. in State Medicine of the University of London.

University of Edinburgh.—Two degrees in Science in the Department of Public Health are conferred by the University of Edinburgh, viz., Bachelor of Science in Public Health and Doctor of Science in Public Health. Candidates for the degree of B.Sc. in Public Health must be graduates in Medicine of a University of the United Kingdom, or of some other University recognised for the purpose, and must pass two examinations, for the first of which they must, after graduation in Medicine, have worked for at least 20 hours per week during a *period of not less than eight months*, of which at least five consecutive months must be in the Public Health Laboratory of the University of Edinburgh and the remainder either there or in a laboratory recognised by that University; they must also have attended courses of instruction in Physics and Geology in some Scottish University. Candidates are not admitted to the Second Examination sooner than six months after having passed the First Examination, nor sooner than 18 months after having taken their degree in Medicine, and they must have attended two separate courses in Public Health *in some University of the United Kingdom* or in such medical school or Indian, Colonial, or Foreign University as may be approved for the purpose by Edinburgh University, each course consisting of 40 lectures at least; one of which courses shall deal with medicine and the other with engineering, each in its relation to public health. They must also give evidence that, subsequent to graduation in medicine, (1) they have during three months, which must be separate and distinct from the period of laboratory instruction, been diligently engaged in acquiring a practical knowledge of the duties, routine and [illegible] staff officer of the Royal Army Medical Corps, having charge of an army corps, district, or command, recognised *for this* purpose by the General Medical Council; (2) that they have attended during three months the practice of a hospital for infectious disease, at which opportunities are afforded for the study of methods of administration; and (3) that they have had three months' instruction in mensuration and drawing. The subjects of examination include Laboratory work, Physics, Geology, Medicine in its application to Public Health, Sanitation, Sanitary Law, and Vital Statistics. Graduates who have held the degree of B.Sc. in Public Health from the University of Edinburgh for a term of five years *may offer themselves for the* degree of D.Sc. in Public Health in that University. They must then present a Thesis and pass an examination in Public Health. The fees are £3 3*s*. for the First and £3 3*s* for the Second B.Sc. Examinations, and *£10 10s. for the* degree of D.Sc.

University of Aberdeen.—The Diploma in Public Health (D.P.H.) *is conferred* only on graduates in Medicine of a University in the United Kingdom; and a period of not less than 12 months must elapse between medical graduation and entrance to the examination for the diploma. Every candidate must produce evidence of having attended, after graduation in Medicine, during a period of six months, practical instruction in Hygiene and Bacteriology in laboratories approved of by the University, together with having during six months (whereof three months must be distinct from the period of laboratory instruction) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health administration under the medical officer of health of a county or large urban district. He must have regularly attended for three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration. He must also have obtained practical instruction in the drawing and interpretation of plans. Every candidate who is not a graduate in Medicine of this University must have attended a course of instruction in the University in one or more of the subjects embraced in the examination for the diploma. The diploma is conferred after an examination in Public Health held in March and July of each year. Candidates must send in their names, with the necessary fee, to the Secretary of the Medical Faculty a fortnight before the examination. The fee is £5 5*s*. The examination is conducted by specially qualified examiners appointed by the University. Candidates may enter for the whole examination at one period or they may enter for Part I. at one period and for Part II. at another and subsequent period.

National University of Ireland.—The regulations for the Diploma in Public Health of the National University of Ireland *have not yet been published, but as a guide to their* probable form we print a summary of those of the expiring Royal University. Candidates are not admitted to this examination until the lapse of 12 months from the time of their graduation. Candidates are required to produce a certificate of having, after obtaining the degrees of M.B., B.Ch., B.A.O., attended six months' practical instruction in a laboratory approved by the University, and also of having for six months practically studied the duties of outdoor sanitary work under the medical officer of health of a county or large urban district, and also *of having attended for a period of three months the* practice of a hospital for infectious diseases. Candidates at this examination must answer in the following subjects: (1) *Physics*, (2) *Chemistry*, (3) Meteorology, (4) Sanitary Engineering and Architecture, (5) Bacteriology, and (6) Hygiene, Sanitary Law, and Vital Statistics.

University of Dublin.—The Diploma in Public Health is conferred, after examination, on the following conditions. The candidate must be a Doctor in Medicine or a graduate in Medicine, Surgery, and Midwifery of Dublin, Oxford, or Cambridge. The candidate must have obtained a registrable qualification at least 12 months before the examination. The candidate must have completed (unless registered as a practitioner on or before Jan. 1st, 1890), subsequently to *obtaining a registrable qualification, six months' practical* instruction in a chemical and bacteriological laboratory or laboratories approved by the University, must have studied practically outdoor sanitary work for six months under an approved officer of health (*at least three months of this* period being distinct from the time spent in laboratory wor[illegible] whe[illegible] of [illegible] Par[illegible] (inc[illegible] and [illegible] Vital [illegible] ing and Reports.

Queen's University, Belfast.—A Diploma in Public Health is given by examination to every candidate who must produce evidence that, after obtaining a registrable qualification, he has during six months received practical instruction in a laboratory or laboratories, British or foreign, approved by the Licensing Body granting the diplomas, in which Chemistry, Bacteriology, and the Pathology of the diseases of animals transmissible to man are taught.[5] He

---

[5] [illegible] of six months may be reduced to a period [illegible]

First Professional Examination on production of the required certificates. The Examination consists of Mechanical Dentistry and Dental Metallurgy, the examination in Dental Metallurgy being by written paper. III. The Second Professional Examination.—The candidate must produce the following certificates: 1. Of having been engaged during four years in the acquirement of professional knowledge subsequently to the date of registration as a dental student. 2. Of having attended at a recognised dental hospital and school (*a*) a course of Dental Anatomy and Physiology; (*b*) a separate course of Dental Histology, including the preparation of microscopical sections; (*c*) a course of Dental Surgery; (*d*) a separate course of Practical Dental Surgery; (*e*) a course of not less than five lectures on the Surgery of the Mouth, which lectures may be given at a dental hospital or at a recognised medical school; in the latter case they may form part of the course of lectures on Surgery; (*f*) a course of Dental Materia Medica; and (*g*) a course of Dental Bacteriology. 3. Of having attended at a recognised dental hospital or in the dental department of a recognised general hospital the practice of Dental Surgery during two years. 4. Of having attended at a recognised medical school (*a*) a course of lectures on Anatomy, (*b*) a course of lectures on Physiology, (*c*) a separate Practical Course of Physiology, (*d*) a course of lectures on Surgery, and (*e*) a course of lectures on Medicine. The lectures on Surgery and Medicine must be attended after the completion of the courses of lectures on Anatomy and Physiology. 5. Of having performed Dissections at a recognised medical school during not less than 12 months. 6. Of having attended at a recognised hospital the practice of Surgery and Clinical Lectures on Surgery for twelve months during the ordinary sessions. 7. Of being 21 years of age. The certificates of professional study will be required to show that students have attended the courses of professional study to the satisfaction of their teachers. All students joining the Dental Hospitals after Oct. 1st, 1909, will be required to attend a course of practical instruction in the anæsthetics in common use in the practice of Dental Surgery. Candidates may present themselves for the Second Professional Examination after the completion of four years' professional study from the date of registration as a dental student and after the lapse of not less than six months from the date of passing the First Professional Examination. The Second Professional Examination consists of: Part I., General Anatomy and Physiology, General Surgery and Pathology; Part II., Dental Anatomy and Physiology, Dental Pathology and Surgery, and Practical Dental Surgery. The written examination in Part I. comprises General Anatomy and Physiology, General Pathology and Surgery, and in Part II., Dental Anatomy and Physiology, and Dental Pathology and Surgery. At the Practical Examination candidates may be examined (*a*) on the treatment of Dental Caries and may be required to prepare and fill cavities or to do any other operation in Dental Surgery (candidates must provide their own instruments); (*b*) on the Treatment of the various irregularities of Children's Teeth. There is also an Oral Examination. Candidates may take the two parts of the examination together or separately. Candidates must pass Part I. before proceeding to Part II. If they fail in Part I. they are not allowed to proceed with Part II. Exemption from the Preliminary Science Examination is granted to candidates who have passed an Examination in Chemistry and Physics for a degree in Medicine at a University in the United Kingdom, in India, or in a British colony. Exemption from Examination in Anatomy and Physiology is granted to candidates who have passed the Second Examination of the Examining Board in England or the corresponding Examination for any degree or qualification in medicine or surgery registrable under the Medical Act of 1886. Exemption from Examination in General Surgery and Pathology is granted to candidates who have passed the Examination in Surgery of the Examining Board in England or the corresponding Examinations of the Colleges and Universities above mentioned. The fee for the diploma is 20 guineas and is payable as follows:—Preliminary Science Examination, 3 guineas; First Professional Examination, 2 guineas; Second Professional Examination, 5 guineas; the balance to be paid on the completion of the Examinations. The Preliminary Science Examination is held in January, March, or April, July, and October in each year. The First and Second Professional Examinations are held in May and November in each year. Candidates must give 21 clear days' notice of their intention to present themselves for examination.

Royal College of Surgeons, Edinburgh.—For the Licence in Dental Surgery all candidates must pass a Preliminary Examination in General Knowledge and have their names inscribed in the Register of Dental Students of the General Medical Council. A copy of regulations giving a list of Preliminary Examinations recognised for obtaining this Licence, as well as of the subjects of the Professional Examinations, may be obtained from Mr. D. L. Eadie, Clerk to the Royal College of Surgeons, at 54, George-square, Edinburgh. Students who commenced their professional education by apprenticeship or attendance on lectures before July 22nd, 1878, are exempt from the Preliminary Examinations. Candidates must produce certificates of having, subsequently to the date of registration, been engaged for four years in professional studies and of three years' instruction in Mechanical Dentistry from a registered dental practitioner, except in the case of previously registered medical practitioners, when two years will be considered sufficient. Candidates must have attended the following curriculum: Anatomy, one course of six months; Practical Anatomy, twelve months; Chemistry, with Laboratory Instruction, one course of six months; Physics, with Laboratory Instruction, three months; Physiology, with Laboratory Instruction, one course of six months; Surgery, including Surgical Pathology, one course of six months; Medicine, including Medical Pathology, one course of six months; and attendance on the practice of a recognised general hospital, with Clinical Instruction on Surgery and Medicine, twelve months. These courses must have been attended at a University or in an established school of medicine or in a provincial school specially recognised by the College as qualifying for the diploma in Surgery. In addition to these courses candidates will be required to have attended in a recognised dental hospital, or with teachers recognised by the College, the following special courses of lectures and instruction: Dental Anatomy and Physiology (Human and Comparative) (not less than 24 lectures), with Practical Dental Histology, three months; Dental Surgery and Pathology (not less than 20 lectures), with the Materia Medica and Therapeutics applicable to Dental Surgery, three months; Dental Mechanics (not less than 12 lectures), Theoretical and Practical, with Dental Metallurgy, three months—one course each; two years' attendance at a dental hospital or the dental department of a general hospital recognised by the College. Practical instruction in Mechanical Dentistry from a registered Dentist, or in the Mechanical Department of a recognised dental hospital and school, as apprentices or otherwise, either before or after registration, for *three* years. Certificates of attendance on such of these courses as may be respectively required will entitle candidates to appear either for the First Dental Examination or for the First and Second Examinations for the Triple Qualification, as they may select, and subject to the existing regulations for each qualification. Candidates who have passed the First and Second Examinations for the Triple Qualification will be exempt from the First Dental Examination and will have the advantage of being admissible either to the Final Dental Examination or to the subsequent Examination for the Triple Qualification, or to both. But the First Dental Examination will not be held as equivalent to the First and Second Triple Examinations and will admit to the Final Dental Examination only. Candidates who are Licentiates of this College or who may be registered medical practitioners will be required to produce certificates of attendance on the special subjects only and will be examined in these only for the dental diploma. First Professional Examination: The candidate must have attended the courses on Anatomy, Physiology, Chemistry, and Physics. The examination embraces Anatomy, Physiology, Chemistry, and Physics. The fee is £5 5*s.*, for re-entry £3 3*s.* Second Examination: The candidate must have attended the remaining courses of the curriculum, must produce certificates showing that he is 21 years of age, and must pay a fee of £10 10*s.*, for re-entry £5 5*s.* The examination embraces Surgery, Medicine, Therapeutics, and the special subjects of Dental Anatomy and Physiology, Dental Surgery and Pathology, and Dental Mechanics with Dental Metallurgy, with a Practical Examination. Candidates who claim exemption from the First Dental Examination on the ground of having passed the First and Second Triple Qualification Examinations will, before being admitted to the Second *Dental Examination*, be *required to pay the total fee* of £15 15*s*. payable for the dental diploma. Fees and schedules must be lodged not later than *one week* before the examination with Mr. D. L. Eadie, 54, George-square, Edinburgh, Clerk to the College.

[illegible] *Surgeons of Glasgow.*—The [illegible] curriculum, number, and [illegible] &c., are in effect similar [illegible] of Surgeons of Edinburgh, but embrace Dental Bacteriology. Special provision is made for candidates who intend to qualify both in Medicine and in Dentistry. Candidates can enter for the First Examination in three divisions, the first embracing Physics and Chemistry, the second Dental Metallurgy and Dental Mechanics and the third Anatomy and Physiology. There is at the Final Examination an examination in Practical Dentistry conducted in a dental hospital.

Royal College of Surgeons in Ireland.—Candidates for the Licence in Dental Surgery *are required* to pass two professional examinations, and to produce the following certificates before admission to the several examinations :—

First Dental Examination.—(A) Of having attended courses of instruction in the following subjects at an institution recognised for the purpose : (*a*) Practical Chemistry, including Metallurgy (three months) ; (*b*) Physics, Theoretical and Practical (six months). The courses for these certificates need not be completed within one year, nor need they run concurrently ; and they may be commenced or attended before the candidate registers as a medical or dental student. (B) 1. Of having passed a recognised Preliminary Examination in general education, and of having been registered as a medical or dental student by the General Medical Council. 2. Of having, subsequently to registration as a dental or medical student, attended courses of instruction in the following subjects at a recognised school of medicine : (*a*) Dissections with Demonstrations (the candidates must dissect the head and neck three times) (12 months). (*b*) Physiology, including Dental Physiology. Lectures (six months). (*c*) Practical Physiology and Histology, including Dental Physiology and Histology, Human and Comparative (three months).

Final Dental Examination.—1. Of having been engaged during a period of two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist, or under the direction of the superintendent of the Mechanical Depart[illegible] Dental Hospital where the arrange[illegible] Dentistry are satisfactory to [illegible] This instruction may be commenced or attended before the candidate registers as a medical or dental student. 2. Of having passed the First Dental Examination. 3. Of having attended, at institutions recognised by the College for the purpose, the following [illegible] Mechanics. Lectures. Two courses. (*c*) Dental Anatomy. Lectures. One course. (*d*) The practice of a Dental Hospital, or of the Dental Department of a General Hospital. Two years. 4. Of having attended Clinical instructions at a recognised General Hospital during the ordinary teaching sessions (nine months). 5. Of having been engaged during four years in the acquirement of professional knowledge subsequently to the date of registration as a medical or dental student. One year's *bonâ fide* apprenticeship with a registered dental practitioner, after being registered as a medical or dental student, may be counted as one of the four years of professional study. 6. Of being 21 years of age.

In the First [illegible] dates will be examined in (A) [illegible] ding Practical Chemistry and [illegible] hysiology, and Histology—Gen [illegible] ibjects may be passed at the same time, or they may be passed in two groups, (A) and (B). Before presenting themselves for examination in either group, candidates must have attended the required courses of instruction in the subjects of the group for which they present themselves. The examination is partly written, partly *vivâ voce*, and partly practical.

In the Final Dental Examination candidates will be examined in General Pathology, Medicine, and Surgery; Dental Surgery, and Dental Pathology, with the Materia Medica and Therapeutics applicable to Dental Surgery; Dental Mechanics and Metallurgy; Orthodontia. Candidates must pass in all the subjects at one examination. The examination is partly written, partly *vivâ voce*, and partly practical, and includes the examination of patients and the performance of dental operations. Candidates are required to provide their own instruments and gold for filling. The First Dental Examination will commence on the first Mondays in the months of February, May, and November. The Final Dental Examination will commence on the second Mondays in the months of February, May, and November. The fee for the *Diploma in Dental Surgery is* 20 guineas, and is payable in the following manner, viz., F[illegible] each admission, £3 3*s*. ; F[illegible] Final, each admission, £[illegible] ant of Diploma, £8 8*s*. ; total, £21. Fees will not be refunded *under any circumstances*. Candidates must pay the fees for examinations from which they are exempted, unless when such exemptions have been granted in virtue of examinations passed before the Conjoint Board in Ireland.

University of Birmingham.—The teaching of Dentistry is undertaken by the University acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board, so that the students may fully qualify themselves for the Dental diploma of this and other universities and licensing bodies. There is a special and well-equipped Dental Museum and Laboratory. An Entrance Exhibition, value £37 10*s*., is awarded annually at the commencement of the winter session. The following are the regulations for Degrees in Dentistry :—1. The degrees conferred by the University are those of Bachelor and Master of Dental Surgery (B.D.S. and M.D.S.). 2. All candidates for these degrees must pass the same Matriculation Examination as that required *from* candidates *for* Medical Degrees. 3. The *degree of Bachelor of Dental Surgery is not conferred* upon any candidate who has not obtained a Licence in Dental Surgery. The candidate is not eligible for the degree until a period of 12 months has elapsed from the passing [illegible] Of this [illegible] departm[illegible] 4. A. [illegible] candidate must produce evidence that he has attended the courses required by medical students of the University in the following subjects and passed the Examinations held in the same for Medical and Surgical Degrees : (*a*) Chemistry [illegible] tions in each of these subjects : (*f*) One Special Course of Lectures on Medicine, (*g*) One Special Course of Lectures on Surgery, and (*h*) Pathology and Bacteriology. *C.* That he has attended courses and passed the class examinations in : (*k*) Dental Histology and Patho-Histology, (*l*) [illegible] y, and (*m*) Dental Surgery and [illegible] at he has received instruction [illegible] of living cases at the dental department of a general hospital for a period of not less than six months. 5. The Final Examination will deal with the subjects in Classes *C* and *D*. 6. On the expiration of 12 months from the date of passing the Examination for the Degree of Bachelor of Dental Surgery, the candidate will be eligible for that of Master of Dental Surgery. 7. For this degree candidates will be required to submit a thesis containing original work and investigations in some subject connected with Dentistry, which thesis shall be submitted to examiners to be nominated by the *Dental Advisory Board. The degree will be awarded or withheld* according to the report of these examiners.

The University also grants a diploma in Dental Surgery (L.D.S.) to candidates who have followed the prescribed regulations for the same.

University of Durham.—A Diploma in Dental Surgery is granted. The conditions are as follows :—Every candidate for the Diploma must pass the necessary examination required by the General *Medical Council for registration as* a dental student. There are four Examinations—viz., First, Second, Third, and Final. The subjects of the Examinations are :—*First :* (*a*) Chemistry; and (*b*) Physics. *Second :* (*a*) Dental Mechanics, Theoretical and Practical ; (*b*) Dental Metallurgy ; and (*c*) Dental Materia Medica. *Third :* (*a*)

Patients are admitted between 8.45 and 9.30 A.M., and are seen by the dental surgeon for the day, the dental house surgeon, the assistant dental house surgeon, and the dressers. Such cases as are suitable for conservative treatment are transferred to the conservation room, taking with them a chart to indicate the treatment required. *The Conservation Room:* This room is open from 9 A.M. till 5 P.M. There are 55 Morrison chairs, each fitted with a saliva ejector, for the use of the Dressers, who, under the supervision of the Staff, perform the various operations of Dental Surgery. The members of the staff attend every morning and afternoon to give demonstrations and otherwise assist students in their work in the Conservation Room and Mechanical Laboratory. Pupils in Dental Mechanics are received, and a graded, systematic, and full course of instruction, extending over two years, is carried out. The control and supervision of the *Pupils' Laboratory* is in the hands of the following staff: The Demonstrator of Dental Mechanics, Two Staff Demonstrators of Prosthetic Dentistry, Two Skilled Mechanics and their Assistants. Dental students have the opportunity of attending at this hospital the whole course of instruction required by the examining board for the L.D.S. Eng., viz., two years' pupilage in dental mechanics, the special lectures and practice of the Dental Department and the general lectures and practice of the Medical School. The fees for these two courses may be paid separately or together, or they may be combined with the fees required to be paid for the course for a medical diploma. Students who enter for a medical as well as a dental diploma are allowed to pursue their study of Dentistry during any period of their medical course most convenient to themselves without further charge. Two Entrance Scholarships in Dental Mechanics of the value of £20 each are offered for competition annually, one in September and one in April, and prizes of the aggregate value of £47 are awarded for general proficiency and for skill in Practical Dentistry. Dental students are eligible for admission to the Residential College and enjoy the privileges of students in the Medical School.

Staff.—Consulting Dental Surgeon: Mr. F. Newland-Pedley. Dental Surgeons: Mr. W. A. Maggs, Mr. Wynne Rouw, Mr. H. L. Pillin, and Mr. M. F. Hopson. Assistant Dental Surgeons: Mr. J. B. Parfitt and Mr. J. L. Payne. Demonstrators of Practical Dentistry: Mr. E. B. Dowsett, Mr. F. J. Pearce, Mr. H. P. Aubrey, Mr. H. Chapman, and Mr. H. O. Malleson. Demonstrators of Prosthetic Dentistry: Mr. S. W. Charles and Mr. E. A. Tomes. Anæsthetists: Dr. H. F. Lancaster, Mr. C. J. Ogle, Mr. W. M. Mollison, Mr. A. R. Thompson, Mr. R. Davies-Colley, and Dr. F. E Shipway. Lecturers:—Dental Anatomy and Physiology: Mr. Maggs. Dental Surgery and Pathology: Mr. Wynne Rouw. Operative Dental Surgery: Mr. Parfitt. Dental Mechanics: Mr. Payne. Practical Dental Mechanics: Mr. Pillin. Dental Materia Medica: Dr. A. P. Beddard. Dental Bacteriology: Dr. Eyre. Dental Microscopy: Mr. Dowsett and Mr. Kennaway. Metallurgy: Dr. J. Wade. Practical Dental Metallurgy: Mr. Hopson. Curator of Dental Museum: Mr. Dowsett. Dean: Dr. Eason.

London Hospital.—Mr. F. M. Farmer and Mr. J. Scott MacFarlane give practical instruction during the winter and summer sessions daily at 9 A.M. Dental Dressers are appointed every three months. A course of lectures, specially arranged for Medical students, will be delivered during May and June. The lectures will be supplemented by demonstrations of practical work and will be specially directed to meet the requirements of the medical practitioner. They will comprise a short description of the Anatomy and Physiology of the Teeth, special attention being given to Oral Hygiene; Irregularities of the Teeth, with special reference to cases which may be treated by surgical means as distinguished from those requiring dental appliances; Dental Caries and its Treatment, which will be specially directed to palliative dressings and simple fillings; Diseases of the Dental Pulp and Periosteum and their Treatment; and Neuralgia and other Affections arising from dental causes. The practical work will include exercises in the extraction of teeth and the preparation of cavities and simple fillings on models specially prepared. 9366 dental cases were treated during 1908.

PROVINCIAL.

University of Bristol.—Laboratories for instruction in Mechanical Dentistry and in Dental Metallurgy have been established in the University and Dental students can enter for the full curriculum at Bristol. The Lectures are delivered at the University. Practical instruction is given at the *Royal Infirmary* by Mr. Ackland and at the *General Hospital* by Mr. Dowling, both institutions being recognised by the Dental Board of the Royal College of Surgeons of England. Full information may be obtained of the Dean of the Medical Faculty, Professor Edward Fawcett, the University, Bristol.

Devon and Exeter Dental Hospital, 24, Southernhay, West, Exeter.—Established 1880.—The hospital is open daily (Sundays excepted) and patients are admitted between the hours of 9 and 11 A.M. Students attending the practice of the hospital must consider themselves strictly under the control of the medical officers and must not undertake any operation without the consent of the dental surgeon for the day. Hon. treasurer, Mr. J. M Ackland; secretary, Mr. W. Alfred Hooker.

SCOTLAND.

The Incorporated Edinburgh Dental Hospital and School.—The Edinburgh Dental Hospital and School is located in a spacious and well-equipped building at 31, Chambers-street and offers special advantages to dental students. The General Courses required for the Dental Diploma may be taken in the Medical School of the Royal Colleges of Physicians and Surgeons or in the University schools. The hospital attendance and clinical instruction are taken at the Royal Infirmary. The University, Medical Schools, and Royal Infirmary are within three minutes' walk of the Dental Hospital. The special courses are taken in the hospital. The Dental Hospital practice, extending over two years, affords a student ample opportunity for a full acquaintance with every branch of dentistry. The hospital admits a limited number of indentured pupils. They receive their instruction in Mechanical Dentistry concurrently with the general and special courses. A premium of 60 guineas is payable with each such pupil. The practice and lectures of the hospital are recognised by, and qualify for, all the Licensing Boards. For the special classes, both theoretical and practical, required by dental students the directors have secured the services of an efficient staff of dental officers and lecturers. There will also be a course of demonstrations in Mechanical Dentistry. Students will receive instruction in Practical Dental Mechanics under the mechanician. The cost of the hospital outfit of instruments is included in the Dental Hospital fee of £31 10*s.* The minimum cost of classes and Diploma for the whole course of dental instruction amounts to £90 7*s.* Those students who desire to take a Medical and Surgical Diploma in addition to the L.D.S. have in this school admirable facilities for so doing. The triple qualification of the Royal College of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow is recommended. The minimum cost of the Professional Education Triple Qualification and Licence in Dental Surgery amounts to £169 7*s.* The mechanical department is large and airy and furnished with all modern tools and appliances. The winter session commences Oct. 1st. The Museum is open to students for study. Further particulars can be obtained from the Dean, Mr. W. Guy.

Incorporated Glasgow Dental Hospital and School, 15, Dalhousie-street, Garnethill, Glasgow.—The winter session will begin in October and the lectures will be delivered as follows. In Dental Mechanics on Tuesday and Thursday at 7 P.M., by Dr. Hugh McKay, and in Dental Metallurgy on Monday and Wednesday at 7, by Mr. W. Bruce Hepburn, L.D.S. Fee for each of the above courses of lectures, £3 3*s.* The lectures and instruction at the Glasgow Dental Hospital and School are recognised by all the licensing bodies in the United Kingdom. The fees for two years' hospital practice are £15 15*s.* Intending students before commencing to attend the lectures or hospital practice must produce evidence of having passed the preliminary examination prescribed by the regulations of the General Medical Council for registration of dental students. The hospital is opened daily from 5 to 7 P.M. (Saturdays excepted). Students may only enrol during the months of April or October. Summer session begins in April.

Glasgow Royal Infirmary (Dental Department).—Mr. Wm. Taylor attends at the Royal Infirmary at 3.30 P.M. on Mondays, Wednesdays, and Fridays, and gives a course of instruction in Dental Surgery on these days. The following course in the curriculum can be taken at

St Mungo's College: Anatomy, six months; Practical [illegible] istry, [illegible] three [illegible] ateria [illegible] Dental Surgery, six months, and attendance for two years on the dental department of the hospital. The attendance on the Dental Clinic is free to students of the hospital. The winter session opens Thursday, Oct. 15th.

ANCILLARY SCIENTIFIC INSTITUTIONS.

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY, London (with which is incorporated the ROYAL SCHOOL OF MINES, and of which the CITY AND GUILDS COLLEGE is a Constituent College).—Mechanics and Mathematics: Professor J. Perry, F.R.S., and Dr. A. R. Willis. Biology: (Zoology) Professor A. Sedgwick, F.R.S., and Professor J. B. Farmer, M.A., F.R.S. (Botany). Chemistry: Professor Sir Edward Thorpe, F.R.S., Dr. M. O. Forster, F.R.S., Dr. J. C. Philip, M.A., Ph.D., D.Sc., and Dr. G. T. Morgan, D.Sc., A.R.C.S. Physics: Professors H. L. Callendar, F.R.S., the Honourable R. J. Strutt, F.R.S., Dr. W. Watson, F.R.S., and Mr. A. Fowler. Geology: Professor W. W. Watts, F.R.S., and Dr. Cullis. Metallurgy: Professor W. A. Carlyle, M.E., M.I.M.M. Mining: Professor S. H. Cox. The College reopens on Tuesday, *Oct. 5th, 1909.* Communications should be addressed to the Secretary, Imperial College, South Kensington, S.W.

ELECTRICAL STANDARDIZING, TESTING, AND TRAINING INSTITUTION, Faraday House, 62–70, Southampton-row, W.C. —Principal, Hugh Erat Harrison, B.Sc. Lond. Instructor in Mathematics and Physics: Alexander Russell, D.Sc. Glasg., M.A. Cantab. Instructor in Chemistry: Mr. J. Thomas, B.Sc. Lond. Instructor in Mechanical Engineering: Mr. Walter H. Bell, A.M.Inst.C.E. This institution, in addition to its ordinary course of training in electrical engineering, which occupies four years, also arranges for special instruction in all branches of electricity either by private tuition or by a specially arranged course at the College or at the works of the companies with which it is associated. There are Entrance Scholarships of the value of 150 and 100 guineas. Particulars may be obtained on application to the Secretary, Mr. Howard Foulds, Faraday House, Southampton-row, W.C. Session begins Sept. 20th.

SCHOOL OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.—Chemistry and Physics: Professor Arthur W. Crossley. Botany: Mr. H. J. Jeffery, A.R.C.Sc. Pharmaceutics: Professor Greenish (Dean of the school). The session commences on Wednesday, Sept. 29th, on which day the inaugural address will be delivered by Professor Tschirch of the University of Bern. Medical students, or pupils intending to enter the medical profession, are admitted [illegible] ork in any or all the courses. [illegible] is school are received by the [illegible] Colleges. Application for admission to the school, or for further information, may be made to the Dean, 17, Bloomsbury-square, London, W.C.

ROYAL SANITARY INSTITUTE (WITH WHICH IS INCORPORATED THE PARKES MUSEUM), 90, Buckingham Palace-road, S.W.—The objects of the Royal Sanitary Institute are to promote the advancement of sanitary science in all or any of its branches and to diffuse knowledge relating thereto. It was founded in 1876 and incorporated in 1888. Sessional meetings are held in London and in various provincial centres from time to time for the reading of papers and for discussions upon subjects connected with sanitary science, and lectures and demonstrations are arranged for sanitary officers; in sanitary science as applied to buildings and public works, suitable for foremen of works, builders, and those engaged in the allied trades; for army officers and professional men on food and meat inspection; for meat inspectors; for women health visitors and school nurses; and for school teachers. Examinations *are held in London,* provincial, and colonial centres and certificates of competency in sanitary knowledge are granted. The Parkes Museum, which is maintained by the institute, contains a great variety of the most approved forms of apparatus and appliances relating to health and domestic comfort. Professors and teachers of hygiene are allowed the use of the museum for demonstrations to their students on application to the committee. The museum is open daily from 9.30 A.M. to 5 30 P.M. *and on* Mondays to 8 P.M. and is free of charge except when lectures or meetings are being held. There are also a large library of sanitary literature which contains, in addition to standard works on sanitary science, a collection of reports of medical officers of health over the whole country, and a reading room supplied with the principal sanitary periodicals, both home and foreign. The institute is under the *patronage of the* King, and the officers are: President, the Duke of Northumberland; chairman of council, Mr. H. D. Searles Wood, F.R.I.B.A.; treasurer, Mr. Thomas W. Cutler, F.R.I.B.A.; registrar, Mr. A. Wynter Blyth, M.R.C.S.; and secretary, Mr. E. White Wallis. The lecturers are Dr. C. Porter, Dr. G. F. McCleary, Dr. A. Wellesley Harris, Dr. E. J. Steegmann, Dr. E. Petronell Manby, Professor H. R. Kenwood, M.B., Dr. C. J. Thomas, Dr. H. Meredith Richards, Miss Alice Ravenhill, Colonel J. Lane Notter, R.A.M.C., Mr. J. Osborne Smith, F.R.I.B.A., Mr. W. C. Tyndale, M.Inst C.E., Mr. J. E. Worth, M.Inst. C.E., Mr. J. Wright Clarke, Professor H. Addison Woodruff, F.R.C.V.S., Major J. A. Meredith, F.R.C.V.S., Mr. James King, M.R.C.V.S. For members the annual subscription is £2 2*s.* and for associates £1 1*s.*, but members and associates holding certain qualifications only pay half the ordinary rate of subscription.

THE ROYAL INSTITUTE OF PUBLIC HEALTH.—The Royal Institute of Public Health, 37, Russell-square, W.C., was founded in the year 1886 with the object of obtaining the registration of public health diplomas and the further statutory requirement that all medical officers of health should possess such a qualificat[illegible] members of the Institute, [illegible] decided to create a central [illegible] London and have erected bacteriological, parasitological, and chemical laboratories in which researches of a public-health character are undertaken for municipal and other authorities and for private medical practitioners and the necessary training for obtaining public health diplomas is provided, together with a library, lecture room, and common room. The Royal Institute of Public Health is recognised by the University of London as a public educational institution, and its course of instruction for the diploma by the universities and other examining bodies of the United Kingdom. The Institute is under the patronage of His Majesty the [illegible] Strathcona and Mount Royal [illegible] onsists of—the Principal, [illegible] F.R.S.E.; demonstrator [illegible] demonstrator of bacteriology, Dr. Hermann Dold. Occasional lectures are given by eminent sanitarians. The Harben lecturer for 1909 was Professor R. Pfeiffer, M.D., of Breslau, *and the* Harben lecturer for 1910 is Lieutenant-Colonel W. B. Leishman, R.A.M.C.

THE BRITISH MEDICAL MAN ABROAD.

THE conditions of medical practice have much altered in this country of late, as we have been able to point out in THE LANCET during the past decade. Professional incomes in many places have been lowered seriously by the unfair tactics of so-called medical aid societies, and the position of servant to which some of these associations would reduce their medical officer is one that liberally educated gentlemen do not welcome with enthusiasm. Improvement has taken place recently but *there is yet a time of,* severe struggle ahead. Again the expenses of living have gone up for medical men as they have for all the middle and upper *middle-* classes of this country, while more money is required to secure the necessary medical degrees and diplomas owing to the lengthy curriculum and the more expensive equipment. These facts account, though only partially, for the increased number of medical men who having obtained British medical qualifications desire to settle abroad. Other factors at work *are the spirit of adventure,* the feeling that in a new country there is more elbow-room and more chances of *getting out of the ruck, and the* increased facilities of *transport. Newspapers and books* galore nowadays *make us familiar with life in other lands,* while trains and steamers will take us all over the world in a short time and at a *comparatively small expense.* For *this reason or that,* the number of medical men who make inquiry from us as to their legal and professional position in a foreign country continues to increase, and in the following columns we attempt to give the information.

Speaking generally, our colonies make it easy for medical men from home to practise there, but the same is not the case on the continent, where there is an obvious tendency towards protection. But in the colonies there are not many openings for practice except for those who are willing to "rough" it and work hard. In Canada there are outlying districts where a good start might, perhaps, be obtained; but it must be remembered that Canada possesses advanced medical schools and is a sparsely populated country as yet. In Australia and New Zealand the prospect for the British practitioner is not greater than that which faces him in Great Britain. The medical profession is, in fact, crowded in all places at home and abroad where the circumstances of practice are favourable, and many practitioners who have gone out from the mother country have had to leave the colonies unsuccessful, or have been very hard pushed to make both ends meet. The graduates of the colonial universities every year tend to more than meet the usual vacancies. It used to be generally believed that, even where there was a large supply of general practitioners in the big colonial towns, there would still be good openings for men who have specialised in such branches of practice as the treatment of eye and ear diseases. This is partially true. There are openings of which good men can take advantage. But as a rule the openings in the colonies for new comers are in country districts where the medical man, besides being proficient in every branch of the profession, must be ready to lead a hard life. It is desirable that every colonial practitioner, intending to start in a country district, should be of good physique and not only able to ride but able to take care of his horses.

There are, of course, certain colonial appointments made in this country, particulars of which will be found in our columns. These appointments are sometimes made with permission to practise privately, and sometimes this is not permitted. Candidates for the posts should apply to the Colonial Office for information, and their chances of success will be much increased by having passed through one of the schools of tropical medicine. The duties of colonial medical officers involve medical charge of a district, including as a rule the charge of a hospital and a lunatic asylum. The medical officers also supervise the sanitation of their districts, and as a rule give gratuitous attendance to all Government officials.

The United States of America form a rich and well-populated country to which, as speaking our language, it is natural for the British medical man to desire to go. The regulations for practice in the various States differ much, but it will be found that wherever the social conditions are pleasant and the opportunities for emoluments good there will be plenty of competition. There is an enormous number of medical men in the United States, and the British medical man contemplating starting in medical practice there will be prudent to make full inquiry before deciding on the locality, while his chance of success will be increased by his having some good introductions.

FRANCE.

The law that regulates the conditions of the practice of medicine in France is that of Nov. 30th, 1892, passed by the Senate and the Chamber of Deputies and signed by Carnot, President, and Poincaré, the Minister of Public Instruction, at that date:—

> No one may practise medicine in France unless he hold a diploma of the doctorate of medicine given by the French Government after examinations duly passed in a State institution of higher medical education.

The fifth article of this law specifically refers to foreigners:—

> Physicians who have taken their degree abroad, of whatever nationality, can only practise in France on condition of having obtained in France the degree of doctor of medicine.

This article was modified by a special decree, signed in July, 1893, referring to certain concessions to be made to such foreigners:—

> Physicians with a foreign degree who desire the French degree of doctor of medicine may obtain partial or complete dispensation of medical study and partial exemption from the examinations required In no case will candidates be exempted from more than three examinations. Such exemption is accorded by the Minister of Public Instruction on the recommendation of the competent Faculty and the Committee of Public Education.

While this last quotation may be considered the actual state of the law in the formal sense of the word, further and much less liberal projects have since been considered by the legislative bodies and adopted in the form of *arrêt ministériel*, of *circulaire* issued by the Minister of Public Instruction, or of *décrêt* adopted by Parliament. Presumably too much advantage was taken of the generosity of the concessions of July, 1893, although it must be remembered that the exclusive policy since adopted is by no means aimed at English physicians, but rather against graduates of little-known universities the value of whose qualifications it is difficult to estimate. Be that as it may, in July, 1896, a certain number of exemptions were granted—among whom the writer was fortunate to find himself—and a circular was issued repealing—in substance—the concessions of 1893. No foreign qualifications were to be recognised as deserving of any dispensations and physicians holding foreign degrees and desirous of practising medicine in France were obliged not only to matriculate as medical students but also to produce evidence of having obtained the French diploma of Bachelor in Classical Education (Arts and Philosophy) and the certificate in physical, chemical, and natural science.

The refusal that for the last ten years has almost invariably met the request made by foreign physicians for the right to practise in France is based upon this *arrêt ministériel*. Such requests are answered in the formula—"Depuis 1896, époque à laquelle il y a en une décision du Parlement, il n'est accordé aucune dispense aux étrangers désireux d'obtenir le diplôme d'etat: ils doivent tous produire le baccalauréat." The simplicity and clearness of this statement make translation unnecessary. This exclusive attitude was not, however, wholly maintained. While withdrawing nothing of the exclusiveness of 1896, the Minister could grant leave to foreigners to possess themselves of a formal academic medical degree which, while it entitled the possessor to call himself docteur en médecine de la Faculté de Paris (de Montpelier, Nancy, Bordeaux, Lille, Lyon, or Toulouse), gave him no right whatever to practise on French territory. To obtain this degree the postulant must formulate his request to the Minister on *papier timbré*, enclosing a copy of his birth certificate, his diplomas, and class certificates, formally translated. This honorary degree is readily obtained, and from English candidates it is probable that an appearance in so-called "final" subjects would alone be required.

Up to Dec. 29th, 1906, it was possible to transform the university or academic diploma into a Government degree by becoming a naturalised French subject. On account of the large number of young Russian girls who married in France and thereby became French and claimed the State diploma it has been decided to insist upon the possession by foreigners of the *license-ès sciences* before this transformation can be granted. The fees for this degree amount to between £60 and £70.

The authority conferred on the Minister empowered him to exempt a certain number of students from the necessity of taking the diploma of bachelor, but this at last gave rise to such abuses that various associations both of medical men and of students protested against what they felt to be an injustice, as the proportion of exemptions was 20 per cent. in some of the faculties. A decree of May 12th, 1909, announced that no exemption would from that time be granted to any student. As, however, there was no desire to create obstacles for foreign students who come to Paris in continually increasing numbers, an official circular of June 2nd, 1909, stated that foreign students (but no others) might be granted exemption under the same circumstances as before, provided, that is to say, that their object is to take merely the diploma of the university and not the State diploma, which alone gives the right to practise medicine in France.

ITALY.

Some years ago the British and American consuls at the great centres of Italian population and commerce combined to form an estimate of the money brought annually into the kingdom and spent within its borders by the English-speaking world. That estimate, an approximate one necessarily, which they carefully checked by every qualifying consideration conceivable, amounted to £20,000,000 sterling, about one-third of Italy's whole revenue at that time. Since then the yearly influx of English and especially of American visitors has greatly increased, so that were a similar calculation to be made now the estimate would doubtless be still larger. This is a fact of great importance from whatever [illegible] continuous [illegible] is true that [illegible] object the expulsion of all foreign practitioners from the country, has been carried on by a section of the medical profession in Italy, but the movement has proved only partly successful, the public at large being well aware of the injury which the adoption of such a measure would inflict upon its interests. The British medical men and their American *confrères* form a prominent reason for Italy continually to attract that portion of the travelling public from which she derives so much of her annual revenue. There are therefore excellent reasons why every facility should be offered to them for exercising their calling freely in her cities and health resorts, and we may state at once that the regulations which still exist in Italy with respect to the foreign practitioner are most liberal and fair, it being open to anyone possessing a medical qualification recognised as legal in the country of its origin to engage in practice amongst the foreign visitors and residents within her borders. The restrictions ruling in Switzerland, France, and, indeed, nearly every other European country, do not exist in the Italian kingdom. The medical man's qualification, certified by ability to produce his diploma, is quite sufficient. He has, therefore, (*a*) no examination to pass; (*b*) no fees to pay; (*c*) no Government forms to comply with; and (*d*) requires no previous residence in the country as a "condition precedent" to practise. All the same it will be to his advantage to graduate at an Italian school—Rome, Turin, Pavia, Padua, Bologna, Siena, Pisa, indeed, all Italian Universities, grant degrees to duly qualified practitioners who can pass the examination these Universities require. On the other hand, in a country compelled by its financial requirements to impose taxes in every possible direction the English-speaking practitioner has to pay the heavy income-tax ("*ricchezza mobile*" it is called) of nearly 13½ per cent., besides being liable to the comparatively mild "tassa di famiglia" (tax on domestic servants, &c.), levied on foreign and native residents alike.

As to the career Italy offers it is in some respects better, in other respects worse, than it was some years ago. It is better inasmuch as Italian medicine and surgery have greatly improved of late years, and the foreign practitioner, particularly in those cities which are the seat of medical schools, is not in danger, as he used to be, of getting out of touch with the advance of the profession. Indeed, the British medical man may keep himself *au courant* with the latest accession to medical doctrine as conveniently in the Italian as in any other kingdom. By graduating at one or other of the many Italian schools he can obtain the *entrée* to the medical societies, the congresses (provincial and national), the hospitals, the class-rooms open to the native practitioners, and also become entitled to the reduced railway and steamboat fares conceded on occasion to all duly qualified Italians. Indeed, he is generally welcome to them on the ground of professional *fratellanza* (brotherhood), but the graduation above indicated gives him a right to what he would otherwise owe merely to courtesy. On the other hand, the career is less favourable than formerly on account of the larger number of English-speaking competitors whom it now attracts and who comprise not only Englishmen and Americans, but Swiss, Germans, and other nationalities as well. Their harvest (generally limited to three or four months of the "season") entails immense, almost excessive, activity, compensating the comparative idleness of the months before and after it. Upon this short period of remunerative work the practitioner must therefore rely to carry him through the entire year, and with heavy expenses to meet for housekeeping, house rent, servants' wages, taxes, &c., it becomes a serious matter for him when the "season," as often happens, turns out a poor one. He may certainly be able to supplement his winter's income by taking up practice at one or other of the summer resorts, but such practices are difficult to find and with few exceptions are of little value. Failing this he will find nearly the whole summer on his hands, for it is useless to remain at his post during the hot season while his patients have all left to seek the cooler air of the Alps and the Tyrol or have returned to their own country. Nothing is then left for him but to follow their example and thus to incur the heavy expense of moving somewhere else with his whole family. Nevertheless, for a well-qualified man with sufficient private means to tide him over the first years, and who is possessed of good social introductions, there are always openings where he can still find a profitable *clientèle*, although his possible income at any of the smaller health or pleasure resorts will necessarily be limited.

One word of warning in conclusion. Let anyone who is tempted to buy a practice in Italy proceed with even more caution that he would in negotiating in his own country. In the first place, the foreign population of nearly all Italian towns is largely a floating one, composed chiefly of people who remain for but a few weeks, often for only a few days in one resort, and many of whom never come back again. The vendor of a practice in a place of this sort will have many patients on his books whom he cannot possibly introduce in any way to his successor, and a good many others whom he may introduce but who will never return to the locality, or at best do so only at long intervals, and can therefore form no permanent or profitable part of his successor's *clientèle*. His hold upon the practice is, in fact, of a peculiarly personal kind and cannot, in the nature of things, be easily transferred to another. Secondly, the purchaser himself must be a man fitted for this particular class of work, or he may discover too late that he cannot make it pay and that the capital which he has expended has been spent to no purpose. A similar remark is doubtless true with regard to all such transactions, but it applies with special force in the circumstances now under consideration, where the physician has to deal with patients of such varying types and diverse characteristics as are to be met with amongst the travelling public in an Italian health or pleasure resort. To achieve a full measure of success the foreign practitioner in Italy must not only be a man of good all-round attainments, conversant with all branches of his profession, but should be possessed of an unusual share of sympathy and tact, for the exercise of which he will have daily scope amongst patients on whom illness falls with peculiar sadness, alone, as they so often are, and helpless in a foreign land.

GERMANY.

Foreign diplomas are not legally recognised in Germany as entitling their owners to practise medicine, so that British medical men desiring to settle in that country have to attend all the classes and pass all the examinations. A young German before commencing the study of medicine must pass an *Abiturienten-Examen* requiring a knowledge of French, Latin, Greek, mathematics, history, and theology. Or the examination of a *Real-Gymnasium* or an *Oberrealschule* may be passed. In the latter event more stress is laid on modern languages, mathematics, and natural history, and English is required instead of Greek. Foreigners have, as a rule, to pass this examination, but if they have already passed a similar one in their own country they may be exempted from it by a special order to be obtained from the Minister of Public Instruction for each individual case. Medicine can only be studied at a university; the curriculum lasts five years, after the second of which the examination called the *Tentamen Physicum* must be passed; it includes anatomy, physiology, chemistry, physics, and natural history. After the end of the fifth year the student presents himself for the "State Examination," which is practical as well as theoretical, and includes medicine, surgery, obstetrics, gynæcology, pathology, materia medica, and hygiene. After passing the State examination the medical man, previously to obtaining his qualification, has to perform his practical year as clerk and dresser at a university clinic or a recognised hospital. If the medical man wishes to have the title of "doctor" he has to pass another examination, which is little more than a formality, but the degree of doctor without the State examination does not legally confer the right to practise. This title of doctor is granted by every German university to foreigners, but the conditions differ according to the university. Some universities demand a special course of study and others do not, and the intending candidate must in every case make inquiries of the authorities. The law does not allow qualified British practitioners any exceptional facilities in passing the examinations; the time of study may possibly be made a little less than five years for those who have already studied abroad, but a special order, very difficult to obtain, is always required for this purpose. A thorough knowledge of German is essential, The fees for lectures are at least £130 and the examination fees about £12. The fees for the degree of M.D. vary from £10 to £20, being highest at Berlin University, which is the degree that is most popular with alien medical men. There is sometimes no prohibition set against holders of British diplomas practising in Germany provided they do not make use of any professional titles resembling those of qualified German medical men. Medical men practising in this way *must, however, understand that the law regards them as* unqualified and that they have none of the rights or privileges of the medical profession.

Austria-Hungary.

In order that foreigners may legally practise medicine in Austria it is necessary for them to become naturalised Austrian subjects, which necessitates five years' residence in the country. In special cases the Minister of the Interior, conjointly with the Minister of Education, may grant exemptions from that rule and may permit foreign holders of diplomas to practise in Austria if they comply with the other requirements. These are: The production of a so-called Maturitätszeugnis or certificate of having passed the final examination of the gymnasium, at which the candidate must show a satisfactory knowledge of Latin and Greek, as well as of German or one of the other languages spoken in the Austrian Empire, such as Polish, Bohemian, Italian, also of mathematics, history, natural history, chemistry, geography, and physics. If a British medical man or student has passed a similar examination in his own country he may apply for exemption, which is generally granted; he need only produce proof of his having passed such an examination, in the shape of a certificate, to be translated into German by a properly recognised translator. The medical curriculum lasts 11 semesters, or five and a half years. The holders of foreign diplomas may, however, obtain permission to pass their examinations at shorter intervals than are necessary for the students, so that from 18 months to two years may be reckoned as sufficient. After passing the first theoreticum, or first examination, which comprises biology, anatomy, physiology, and chemistry, and which, as a rule, is passed at the end of the fourth semester, the student is allowed to commence hospital work; at the end of the tenth semester he may present himself for the second theoreticum. This and all other examinations (altogether three in number) are both practical and theoretical and must be completed within eight days. Only one subject is taken each day. It comprises internal medicine, surgery, and pathology, whilst the third and last examination comprises gynæcology, obstetrics, hygiene, materia medica, and ophthalmology; pædiatrics, otology, dermatology, and laryngology are examined in alternately. This last examination the student is expected to pass not later than five years after the first, otherwise he has to present himself again for certain subjects of the first examination, especially anatomy. The fees for the three examinations are £15, and then comes the fee of £6 5*s.* for the degree of M.D., without which degree nobody is allowed to practise. The fees for the lectures are about £35 for the five years, and about £15 for special classes may be added, so that the entire cost of obtaining the degree of M.D. would be from £70 to £75. All the universities confer the degree of M.D., and no distinction is made here as regards the place where the title has been gained, although the University of Vienna is most favoured because it offers the best opportunities for studying. In special cases the Minister of the Interior may *allow a foreign qualification to be recognised as entitling its* holder to practise, only a mere formal examination being required; such a special order is, however, very difficult to obtain. The examinations are entirely oral and are conducted in various languages according to the locality—namely, German in Vienna, Innsbruck, Graz, and Salzburg; German and Bohemian in Prague, and Polish in Cracow and Lemberg. These seven universities are the only ones in Austria, and only they may grant degrees, as the medical schools are invariably integral parts of the universities. If a British medical man wishes to practise in one of the frontier spas or in Karlsbad he will have little difficulty in obtaining permission to do so if he applies for it, especially if he gives an assurance that he will only attend his fellow-countrymen and only for the season. He need not then obtain official recognition of his diploma.

As regards Hungary, the medical curriculum is for practical purposes similar to that in Austria, and the foreigner, whether a holder of a diploma or a student who wishes to practise legally, must become a naturalised subject and n pass the three above-mentioned examinations in Hungarian language. Applications for admission must addressed to the Minister of Education, who decides upon conditions of admission after consultation with the med faculty of Budapest. Usually the applicant has to pass tl medical examinations after having proved his qualifica for admission by a Maturitätszeugnis, or testimonial *sufficient preliminary instruction in two classical langua* chemistry, arithmetic, geometry, and physics. The exami tion is allowed only in the Hungarian language. The total amount to 295 kronen (about £12), and the fee for "pro tion"—i.e., for the M.D. degree—is similar to that in Aust Besides the university in Budapest there is another univer in Klausenburg for which the same rules hold good. Only th two universities may confer medical degrees in Hung In 1906 new regulations were drawn up which are now in hands of the Minister, but they have not been ratified. these rules the Professional Committee demands the pass of the second and third practical examinations from th who gained their diploma before 1901. Those gained their diploma after that year are compelled to the second and third examinations, and in addition to one year in a hospital which is designated for that purp The subjects of the old second examination are as follo clinical medicine, surgery, operative surgery, ophthalmolo obstetrics, and operative obstetrics. The old third pract examination embraces the following subjects: clin medicine (theoretical), surgery (theoretical), forensic m cine, and public hygiene. The new third examina embraces the following subjects: clinical medicine, surg operative surgery, obstetrics and gynæcology, opera obstetrics, ophthalmology, operative ophthalmology, der tology, pædiatrics, and psychology (from the latter three c one is compulsory, decided by lottery). The new sec examination embraces pharmacology, general patholo forensic medicine, public hygiene (all theoretical), pathological anatomy (theoretical and practical). Minister has the right to allow settling in Hungary with demanding the passing of these examinations, but i questionable whether he will exercise this right.

Denmark.

In Denmark only those who have passed the Dan Medical Examination are entitled to practise. In Icel it suffices to have been examined at the Medical Sch in Reykjavik. The medical student before beginning studies must present a diploma of *Examen artium*— examination very similar to the German *Abiturient examen*. At the close of the first year he must pass *Examen philosophicum*. The medical studies proper requ from six to seven years. The foreign student will find agreeable difference from what is customary in ot countries—namely, that all University lectures and clini courses are free, payment of class fees being unknown, a few pounds are required for the examination. On pass the examination the young man becomes entitled to practi and not a few commence at once. The majority, howev prolong their practical training by accepting an appointm as (salaried) junior house physician or house surgeon in o of the numerous hospitals of the country. The most hig valued appointments—namely, those at the Kommune hospi or Royal Frederic Hospital of Copenhagen—were, howev formerly in so great demand that not rarely four, five, or ev *more years elapsed before an aspirant* could secure t coveted position, when he served for one or two years in t different departments of the hospital. This unreasonably lo waiting time is now considerably reduced, as the Associati of Junior Medical Men has arranged with the faculty a other authorities for the establishment of a larger number appointments, which are to be officially considered equivalent to the older appointments at the two hospitals.

The only academical degree for medical men known Denmark is the degree of M.D. It is granted exclusively the University of Copenhagen, and only to those who ha submitted to the faculty an original investigation of u doubted scientific value, the consequence being that only comparatively small number of Danish practitioners posse the degree in contradistinction to what is customary, f example, in Germany. In fact, the Danish degree of M. must be considered as equal to the German title of *Priva docent* or the French title of *professeur agrégé*, as it authoris its possessor to teach publicly in the university.

The only portion of Danish territory where a foreign medical man is permitted to make use of his diploma are the Danish islands in the West Indies, the Governor being empowered to grant such permissions; but he is not likely to do so except during epidemics or when other abnormal conditions obtain.

NETHERLANDS.

A medical practitioner holding British qualifications cannot practise in the Netherlands without being also qualified in the Netherlands. For this purpose it is necessary to pass the medical examinations of one of the universities.

SWITZERLAND.

Foreign practitioners must pass the first, third, and fourth State Examinations. These examinations are held in either French (at Lausanne and Geneva) or German (at Berne, Basle, and Zürich). In addition to the British five years' curriculum practitioners would require one or two years' additional study. The examination fees amount to about £9.

SPAIN.

To practise in Spain it is necessary for the holder of British qualifications to apply to the Minister of Public Instruction and Fine Arts and enclose the degrees, diplomas, or similar credentials which he possesses, and request permission to appear before an examining body. The above documents must be translated by the Interpretation Bureau of the Ministry of State and afterwards presented in the Ministry of Public Instruction, together with a petition to the Minister, clearly stating the applicant's requirements. The examination which confers a licence to practise consists of three parts: 1. A written examination lasting two hours. 2. A *vivâ voce* examination. 3. Clinical examination of a patient and a report upon his condition. The fee for the examination is 40 pesetas (£1 12*s.*). The fee for the diploma is 814.50 pesetas (£32). The length of time between the presentation of the documents to the Ministry of State and Public Instruction and the granting of the diploma is variable on account of the time occupied in the necessary legal formalities. The expenses of translation of the documents likewise vary with their length and the consequent work entailed to be done by the Bureau.

PORTUGAL.

Holders of foreign diplomas must apply for examination at the schools of Lisbon or Oporto or the Faculty of Coimbra. The cost of the examination, including the diploma, is about £50. For the last examination the presentation of a *printed dissertation is required.*

TURKEY.

Every foreign medical practitioner desirous of settling in Turkey for the purpose of practising his profession must undergo the ordeal of the so-called "colloquium." This is a sort of professional examination very easy in itself but a source of annoyance and vexation to Europeans by the dilatory propensities of Orientals and their habit of conducting business in an indolent and easy-going way. The "colloquium" itself takes about half an hour's time, whereas the preliminary steps and arrangements and the subsequent formalities necessary for the final obtainment of the medical permit lasts for weeks and even months. The "colloquium" must at the present time be passed either in French or Turkish without any interpreter, the choice of the language being left to the examinee. The possessor of a foreign diploma is tested, as a rule, in four subjects, and the testing consists in three or four questions in each subject, which the candidate has to answer orally. It has not yet happened that a European physician failed to pass the "colloquium." The fee for it used to be about £8. Two or three years ago it was raised to about £20. I am informed that this was done in order to increase the revenue of the rather inefficie[illegible] Medical School at Haidar Pasha and to diminis[illegible] us medical men flocking to the [illegible] most every country adjoining the Ottoman Empire. A far better means of effectively doing the latter would be to raise the rather low standard of the "colloquium." There are numbers of [illegible] other parts of Turkey [illegible] the case [illegible] With the [illegible]ent new [illegible]troduced [illegible] ctice of foreign medical men, [illegible] has lately already touched [illegible]uestions, such as the service of non-Mussulman practitioners in the Ottoman army. I learn that strict measures will be taken against all those who do not possess necessary qualifications, that the standard of the medical curriculum will be raised, and that the manner of conducting the "colloquium," as well as its character, will be completely changed. Regenerated Turkey intends to organise everything in accordance with modern lines of European efficiency.

RUSSIA.

The law relating to foreign medical practitioners desirous to practise in Russia is contained in the two following paragraphs of the *Vratchebny Ustav* or medical statute:—Section 93 (*a*): No one, whether a Russian subject *or a* foreigner, who has not a diploma or certificate from a university or from an Army Medical Academy, has the right to follow any branch of medical or veterinary practice in Russia: (*b*) foreign medical practitioners who wish to practise medicine in Russia must, without exception, know the Russian language. Section 94: Of foreign practitioners who shall be invited or who may come to Russia the right to decide which of them shall be permitted to free practice here and under what conditions is in the hands of the Medical Council of the Ministry of the Interior; some shall be permitted only after the usual examinations and consequent granting to them of a learned degree; others more distinguished after an oral examination in the Medical Council; lastly, others who have made a name in the scientific world by their writings or unusually successful practice, or who have occupied professorial chairs or other important medical appointments in other countries, may be permitted to practise without any examination, solely on the decision of the Medical Council, confirmed by the Minister of the Interior, as to the worthiness of such practitioners.[1] Previous residence in the country before practice would not be necessary except in the case of the first group mentioned, who would have to pass through the usual five years' course of a Russian medical curriculum. As to the prospects of a British practitioner in Russia, the country and the smaller towns can present no attraction to an English medical man, even if the fees obtainable would support him, which they would not. In the two capitals, Moscow and St. Petersburg, the field is wider. Competition is, however, great, fees are as a rule small, and bad debts many. The frequency of bad debts results from the unwritten law by which medical men do not send in accounts, but leave the patient to pay what he considers a suitable amount.

EGYPT.

Any person in possession of a diploma from a recognised school of medicine is allowed to practise his profession in Egypt after having presented his diploma to the Director-General of the Sanitary Department at Cairo for verification and paid a small fee of 6 piastres. From a recent report of the department it appears that the influx of medical men into Egypt of late years has been very great, so that it is difficult to understand how some are able to gain a livelihood from their profession. The effective control of diplomas which emanate from so many different foreign schools must be at times somewhat difficult, as the Public Health Department has no means of identifying the person who presents the diploma as the person who underwent the examinations which entitled him to it—e.g., there is nothing to prevent a person who has come into possession of a diploma by fraudulent means personifying the legitimate owner of the diploma and obtaining a licence to practise. It is true that in addition to the diploma a certificate of good conduct is necessary from the applicant's Consul before a licence to practise is granted, but in many cases the Consul finds himself in the same difficulty as the department with regard to ascertaining if the person in possession of the diploma is the rightful owner or not. We recommend any one of our readers who is attracted by the idea of medical practice in Egypt to obtain introductions to a resident in Egypt so that he may ascertain the chances of finding a remunerative opening and be provided with a witness to his identity. A knowledge of French or Italian and Arabic would be essential to any new-comer desirous of practising two senior medical officers and the two Grade I. medical officers in charge of Negri Sembilan and Pahang are allowed consulting practice only. Other medical officers are prohibited from private practice except in very special cases where the Resident-General is satisfied that, owing to the absence of private practitioners, it is absolutely necessary to allow the Government medical officer to attend to private patients. The posts of medical officer, Grade II., in the Federated Malay States and the corresponding appointments in the Straits Settlements are filled by the promotion of officers who have entered the service as house surgeons.

---

[1] This Section dates from 1830; it was amended in 1842, 1845, and 1857.

Hong-Kong.—The principal civil medical officer receives £800 per annum, rising to £1000. There are two health officers of the port, four medical officers of health, and four assistant surgeons with salaries of £480 rising to £720. Most of these appointments are pensionable. Private practice is not allowed and free quarters are only given in a few cases.

Mauritius.—There is a headquarters staff consisting of a director with a salary of Rs.10,000, an assistant director with a salary of Rs.8000, two sanitary wardens with a salary of Rs.6000, one assistant sanitary warden with a salary of Rs.5000, an assistant medical officer (Port Louis) with a salary of Rs.5000, a police and prisons surgeon with a salary of Rs.6000, and a health officer with a salary of Rs 5000. There is also a medical inspector attached to the Immigration Department. In the rural districts there are various medical officers, most of whom receive Rs.6000 a year, and are not allowed private practice. Free quarters are not given in most cases. The service is mainly recruited locally. Officers in the service of Mauritius are required annually to contribute 2 per cent. of their salaries towards their pensions.

Seychelles.—There are four medical appointments. The Government medical officer receives Rs. 4500. The assistant Government medical officers receive Rs. 3000. The holders of these latter appointments have free quarters. Private practice is allowed.

Gibraltar.—There is a surgeon of the colonial hospital receiving £275, £55 as medical officer of the civil prison and lunatic asylum, and horse allowance of £42, with private practice. There is also an assistant surgeon with a salary of £300 per annum, but without private practice, who is police surgeon, port surgeon, and surgeon to the port office without additional emoluments.

St. Helena.—The colonial surgeon receives £270 per annum and £27 horse allowance. Private practice is allowed.

Falkland Islands.—There are two appointments, one of which is paid at the rate of £300 per annum, with £25 as health officer, and the other at the rate of £200 per annum. Private practice is allowed in both cases.

Cyprus.—There is a chief medical officer paid at the rate of £500 per annum, two district medical officers paid at the rate of £250 per annum, and one paid at the rate of £200, rising by £10 a year to £250, all enjoying private practice and receiving 2*s.* per diem forage allowance. These are the only medical appointments in the island which are open to English candidates, and they are made by the Foreign Office.

All applicants for medical employment in these 18 colonies must be between the ages of 23 and 30 years, and must be qualified for registration. Preference will be given to those who have held appointments as house physicians and house surgeons; certificates of moral character and of sobriety will be required, and every officer before being appointed will be medically examined by one of the consulting physicians of the Colonial Office. There are pension funds established for widows and orphans in Ceylon, Straits Settlements, the Federated Malay States, Hong-Kong, and Mauritius, to which all permanent Government servants must subscribe 4 per cent. of their salaries.

The West African Medical Staff.—All the medical officers for the service are selected by the Secretary of State for the Colonies. They are engaged in the first instance for one year on probation and, except the principal medical officers, are allowed to engage in private practice as long as it does not interfere with the efficient discharge of their official duties. There are fair allowances when junior officers discharge the work of their seniors by deputy. Stores are transported free, out-of-pocket expenses in travelling are recoverable, there are proper horse, field, and outfit allowances, and all medical men are paid 10*s* per diem extra with free rations, or 3*s.* in lieu of rations, while serving on military expeditions. Candidates for the West African Medical Service must be British subjects of European parentage, preferably unmarried and between the ages of 25 and 35 years. They may choose their colony or protectorate, and as far as possible their wishes will be met, but they must make up their minds carefully as transfers are seldom made.

The grades and salaries of medical officers are shown in the following table:—

Grades.	Gold Coast, Southern Nigeria, *Northern Nigeria.*			Sierra Leone, Lagos.			Gambia.		
	Minimum salary.	Annual increment.	Maximum salary.	Minimum salary.	Annual increment.	Maximum salary.	Minimum salary.	Annual increment.	Maximum salary.
	£	£	£	£	£	£	£	£	£
Principal medical officer*	1000	50	1200	800	50	1000	—	—	—
Deputy principal medical officer ...	700	25	800	—	—	—	—	—	—
Senior medical officers	600	20	700	600	20	700	600	20	700
Medical officers ...	400	20	500	400	20	500	400	20	500

* In the Gold Coast the salary of the principal medical officer is £1000, with duty pay at the rate of £200 a year.

Every candidate selected for appointment will, unless the Secretary of State decides otherwise, be required to undergo a course of instruction for two or three months at the London School of Tropical Medicine or at the Liverpool School of Tropical Medicine. If for any reason he does not undergo the course before appointment he will be required to take out instruction on less favourable pecuniary terms during his first leave of absence. The cost of the tuition, fees, board, and residence during such instruction, amounting to a maximum of £48 8*s.* 10*d.* for three months, will be borne by the Government, and a daily allowance of 5*s.* will be paid to each candidate during the course and may be continued subsequently up to the date of embarkation. These payments will be made subject to the candidate signing an agreement by which he will be bound to refund them (1) if he declines to accept an appointment in any of the colonies or protectorates for which he may be selected; (2) if he fails to obtain the certificate referred to in the next paragraph; or (3) if he relinquishes the West African service for any other reason than mental or physical infirmity or is removed for misconduct within three years of the date of his arrival in West Africa. Every candidate sent to either of the schools of tropical medicine is required to obtain a certificate showing that he has satisfied the school authorities with regard to his regularity of attendance, progress, and proficiency.

The arrangements for special allowances and leave of absence are fair. The ordinary term of residential service is one year, followed by leave with full pay during the voyages to and from England and for four or two months clear in England, according as the officer is returning for further service in West Africa or not. If an officer is detained beyond the year additional leave is given with full pay for ten days in respect of each completed month beyond 12, whether he is returning or not. If he is invalided before the end of the year the leave with full pay is for the voyages and for ten or five days in respect of each completed month, according as he is returning or not. Leave granted on the understanding that an officer will return is known as "return leave" and any pay drawn in respect of such leave is liable to be refunded if an officer does not return. Leave may be extended for a limited period with half or no pay on the ground of ill health or without pay on other grounds. Free passages are given to all officers who are granted leave and on first appointment. On attaining the age of 50 years, or after 18 years' service (of which at least 12 must have been residential), an officer is qualified for a pension calculated at one-fortieth of the last annual salary for each year of service. If invalided after a minimum of seven years' service he is qualified for a pension calculated at the same rate. If invalided before completing seven years' service he is qualified for a gratuity not exceeding three-fourths of a month's salary for each six months of service, provided that he has been confirmed in his appointment and that he is specially recommended by the governor or high commissioner for such gratuity. At the end of nine years (of which not less than six must have been residential) an officer of the West African Medical Staff is permitted to retire with a gratuity of £1000, or at the end of 12 years (of which not less than eight must have been residential) with a gratuity of £1250, such gratuities being *in lieu of* pension.

East Africa, Uganda, Nyasaland, and Somaliland Protectorates.—The salary of a medical officer in these Protectorates is £400 per annum, rising to £500 per annum by annual increments of £20. There are 20 appointments of this rank in the East Africa and Uganda Protectorates, seven in Nyasaland, and two in Somaliland. In East Africa and Uganda there are also certain special appointments at salaries of £600 or £650 per annum. The salary attached to the appointment of principal medical officer in Uganda is £750 [illegible] per annum, rising to £600 per annum by annual increments of £25, in the case of Nyasaland. Private practice is permitted when it does not interfere with official duties. Free passages are provided. Two months' leave on full pay is granted every year, subject to the exigencies of the service, and leave is allowed to accumulate up to *six months*. Officers remaining at their posts for two and a half years are entitled to six months' full-pay leave with free passage each way.

POST-GRADUATE STUDY.

POST-GRADUATE study is divided into three main divisions —the general study of professional subjects (including the special study of some branch), the study of state medicine, and the study of tropical medicine. We have already described the provision made for instructing graduates in the last two divisions, mentioning the procedure necessary to obtain diplomas or certificates for proficiency in them. The following article shows the principal arrangements existing for general post-graduate instruction, and some little repetition has been necessary:—

LONDON.

The London Post-Graduate Association.—The London Post-Graduate Association is now so well known that it is hardly necessary to remind our readers that it is composed of the following hospitals and medical schools (general and special)—viz.: *General Hospitals:* Charing Cross, Guy's, King's College, St. Mary's, St. Thomas's, University College, and Westminster. *Special Hospitals:* The Brompton Hospital for Consumption and Diseases of the Chest, the Hospital for Sick Children (Great Ormond-street), the London School of Tropical Medicine, the National Hospital for the Paralysed and Epile[illegible] Ophthalmic Hospita[illegible] Medical Graduates' [illegible] charge for which is [illegible] or 15 guineas for six months) admits the holder to the clinical instruction in the wards and out-patients' departments, the operations, necropsies, and other hospital practice of all the institutions mentioned above. For the purpose of enabling qualified medical men to keep up to date in their work we can heartily recommend the scheme offered by the London Post-Graduate Association, which thus places the best of all the hospital work in London at the disposal of its ticket-holders. The office of the association is now at 20, Hanover-square. Further particulars may be obtained by writing to the Secretary, the London Post-Graduate Association, 20, Hanover-square, London, W., or by personal application between the hours of 10.30 A.M. and 1 P.M. any week-day except Saturday.

Medical Graduates' College and Polyclinic.—This institution affords to medical practitioners special facilities for acquiring technical skill and for advancing their clinical and scientific knowledge. The building contains lecture- and consulting-rooms, a pathological and clinical laboratory, a Roentgen-ray room, an ophthalmoscope-room, a museum, a library, and reading- and waiting-rooms, &c. Cliniques are given on each working day of the week except Saturday at 4 P.M., and a lecture on medicine, surgery, or their special branches, is delivered daily except on Fridays and Saturdays, at 5.15 P.M. Classes are also held in otology, laryngology, rhinology, ophthalmology, radiography, anatomy, nervous diseases, microscopy, urinary analysis, gynæcology, practical bacteriology, mental diseases, hygiene and public health, and operative surgery. Extra classes in any subject are formed to suit the convenience of practitioners unable to attend those already provided. Special tutorial classes are held for practitioners reading for the higher examinations. A monthly journal, the *Polyclinic*, recording the work done in the college, is issued free to subscribers and members. The annual subscription for medical practitioners of either sex is 1 guinea. Full information can be obtained from the medical superintendent at the college, 22, Chenies-street, Gower-street, W.C. The autumn session will commence on Monday, Sept. 13th.

The Hospitals of the Seamen's Society.—In connexion with these hospitals there are two post-graduate schools—viz., (*a*) the London School of Tropical Medicine; and (*b*) the London School of Clinical Medicine.

(*a*) *The London School of Tropical Medicine.*—The school buildings, laboratories, museum, library, &c., are within the grounds of the Branch Hospital Royal Victoria and Albert Dock (Station, Connaught-road, Great Eastern Railway). Opportunities are afforded to students and others who may be desirous of studying diseases incidental to tropical climates before entering the service or going abroad. In the hospitals of the society are to be found cases of tropical diseases such as may be met with in actual practice in the tropics. There are three courses in the year, each lasting three months, beginning on Oct. 1st, Jan. 15th, and May 1st respectively. The laboratory, museum, library, &c., are open daily and clinical instruction is given daily in the wards of the hospitals. The School Course is recognised by the University of Cambridge for its Diploma of Tropical [illegible] for advanced [illegible] The lecturers [illegible] Dr. Andrew Duncan, Dr. L. Westenra Sambon, Dr. J. M. H. Macleod, Professor R. Tanner Hewlett, Mr. James Cantlie, Mr. E. Treacher Collins, Dr. F. M. Sandwith, Mr. K. W. Goadby, and Professor W. J. Simpson. The Director is Dr. C. W. Daniels. Certificates are granted after examination to those who [illegible] yearly.

(*b*) *The London School of Clinical Medicine* (for qualified practitioners only).—The lecture rooms, pathological laboratories (two), museum, and operative surgery class-rooms, are in the *Dreadnought* Hospital at Greenwich, and the whole hospital of 250 b[illegible] is open to students fr[illegible] Surgical, and Special [illegible] held upon every aftern[illegible] members of the staff and operations are performed daily, whilst out-patients in the Medical, Surgical, and Special Departments are demonstrated by the assistant physicians and assistant surgeons daily in the forenoon. Practical classes are arranged each session in the following subjects: The Practice of Medicine; the Practice of Surgery; Diseases of the Eye; Diseases of the Throat, Nose, and Ear; Diseases of the Skin; Diseases of the Nervous System; Operative Su[illegible] Bacteriology [illegible] the Adminis[illegible] Health; Gyn[illegible] Diseases of C[illegible]; M[illegible] Diseases of Children; Applied Anatomy; and Midwifery. Three sessions of three months' duration are held in each year, beginning on Jan. 15th, May 1st, and Oct. 1st. Every variety of disease may be studied in the wards and out-patient rooms of the hospital, at the dispensaries, and at the affiliated hospitals. Male patients chiefly are received as in-patients by the Seamen's Society, but arrangements have been entered into with the Royal Waterloo Hospital for the reception of graduates who desire instruction in diseases of women and children; with the Bethlem Hospital for those [illegible] and with the General [illegible] rosecution of study in [illegible] ed on the south side of the river, are directly linked to the *Dreadnought* by both railway and tramway, and are affiliated to the London School of Clinical Medicine. The certificates of the school are recognised by the Admiralty, the War Office, and the University of London (for the higher degrees) The supply of material affords exceptional facilities for practical instruction in operative surgery and in pathology on the cadaver. The hospital also offers a wide field for the study of venereal diseases and there is a special department with open-air wards for the treatment of tuberculosis. The teaching staff consists of: Sir Dyce Duckworth, Dr. Frederick Taylor, Dr. J. Rose Bradford, F.R.S., Professor R. Tanner Hewlett, Dr. Guthrie Rankin, Dr. S. Russell Wells, Sir William H. Bennett, Mr. Albert Carless, Mr. William Turner, Mr. Lawrie H. McGavin, Mr. L. Vernon Cargill, Sir Malcolm Morris, Mr. Richard Lake, Dr. Sale-Barker, Dr. T. Lewis, Dr. D. W. Carmalt Jones, Dr. Frederick Langmead, Mr. E. Rock Carling, Mr. C. C. Choyce, Mr. R. Bickerton, Dr. Wilfrid Fox, Mr. G. N. Biggs, Dr. Maynard Horne, Dr. Cecil Hughes, Dr. Vivian B. Orr, and Dr. R. E. Delbruck. The extra-mural lecturers are: Dr. James Taylor, Dr. W. H. B. Stoddart, Professor W. J. R. Simpson, Mr. James Cantlie, Dr. William J. Gow, Dr. Herbert Williamson, M[illegible] Howard, Mr. Herbert S. Pendlebury, Dr. Alexa[illegible] Dr. Robert O. Moon, Dr. Charles O. Hawthorne, Dr. Thomas D. Lister, Dr. William R. Dakin, and Mr. C. C. Choyce, Dean.

The prospectuses, syllabuses, and other particulars of both schools can be obtained on application to the Secretary, Seamen's Hospital, Greenwich, S.E., or from the Deans at the associated Schools.

West London Post-Graduate College, West London Hospital.—The West London Post-Graduate College was started in 1895 and three years later its basis was enlarged by the provision for the post-graduates of lecture-, reading-, and waiting-rooms, &c., while owing to [illegible] of the college these were transferred [illegible] especially constructed for the purpose. Over 1700 post-graduates have been enrolled since its establishment, the yearly entry being now about 200. The hospital, which contains 160 beds, is in the main Hammersmith-road, about three miles from Hyde Park Corner, and very accessible by omnibus, tram, or train. The physicians and surgeons attend daily at 2.30 P.M. Post-graduates accompany the staff and the junior staff on their visits to the wards. Instruction is given in the out-patient department daily at 2.15 P.M. by the assistant physicians and assistant surgeons. The out-patient department has recently been enlarged and there is now ample accommodation for post-graduates to see and to examine the patients in all the special departments of the hospital. Clinical assistants are appointed from among the post-graduates to the Medical and Surgical out-patients and the Special Departments. The fee for a clinical assistantship to non-members is £2 2*s.* for three months, which includes membership of the College on the days on which the clinical assistant attends. Practical classes, limited in number, for instruction in special subjects, as well as in medicine and surgery generally, are held as required. Operations are performed daily at 2.30 P.M. Post-graduates are allowed to stand close to the table and can see the operations perfectly. The surgeons often avail themselves of the assistance of post-graduates at operations. Instruction is given in the administration of anæsthetics by the anæsthetists on the operating days and post-graduates are allowed to administer anæsthetics under their superintendence. Post-mortem examinations are performed at 12 noon, and demonstrations on recent pathological specimens are given on Mondays at 12 noon during each session in the pathological laboratory. Also two demonstrations are given each week on Practical Medicine on Wednesdays and Fridays at 12.15 P.M. Practical lectures and demonstrations are given each afternoon (except Saturdays), at 5 P.M., during the session. Included in this course are lectures by outside specialists on Mental Diseases and on Public Health, and in connexion with the former instruction is also given in certain asylums. The college is licensed for the teaching of operative surgery. The fee is £4 4*s.* each member in a class of four. The practice of the hospital is well adapted to the needs of medical officers of the Royal Navy and officers of the Royal Army Medical Corps and Indian Medical Service who have obtained leave for further professional study, and the certificate of attendance at the college during such leave is recognised by the Admiralty. The college is recognised by the University of London for hospital practice before the M.D. degree and by the Royal College of Surgeons for the necessary work before the Fellowship examination. The pathological laboratory has just recently been completely reorganised and placed in the hands of the pathologist, Dr. Bernstein, who attends there during the whole day and gives instruction in Bacteriology and Microscopy. A special class meets on three mornings a week from 11 to 1, and post-graduates joining the class can work in the laboratory at other times under the guidance of the pathologist. A class meets 12 times and commences at the beginning of each month. The fee for this class in bacteriology and microscopy is £3 3*s.* The fee for the hospital practice, including all ordinary demonstrations and lectures, is £1 1*s.* for one week, £3 3*s.* for one month, £6 6*s.* for three months, £10 10*s.* for six months, £15 15*s.* for one year, and is £25 for a life ticket; all fees to be paid in advance. A practitioner who cannot attend the whole course may attend any ten lectures or demonstrations during the session for a fee of £1 1*s.* A vacation class is held each year in August, the fee [illegible] 2*s.* for the course of one month, including hospital [illegible] or a ticket for a fortnight's hospital practice, including the lectures, can be obtained for £1 11*s.* 6*d.* The fee for a three months' course of instruction in the administration of anæsthetics, including a special class, is £3 3*s.*, or without the class, £2 2*s.* A ticket for any of the above courses will be issued at any date. Arrangements can be made for gentlemen working for higher university examinations to be coached. The Winter Session will commence on Monday, Oct. 11th. All communications should be addressed to the Dean, Mr. L. A. Bidwell, Post-Graduate College, West London Hospital, Hammersmith-road, W.

North-East London Post Graduate College.—This post-graduate school is established in connexion with the [illegible] of Wales's General Hospital, Tottenham, N., which is recognised by the University of London as a place of post-graduate study for the M.D. and M.S. degrees and by the Admiralty and the India Office for purposes of study leave. Facilities are there afforded to qualified medical practitioners for taking part in the work of an active general hospital of 125 beds and for attending demonstrations in various branches of medicine, surgery, and gynæcology, with opportunities for clinical instruction in diseases of the eye, ear, throat, nose, skin, in fevers, psychological medicine, the administration of anæsthetics, and dentistry. Cliniques, lectures, and demonstrations are given by members of the teaching staff in the lecture room, in the wards, in the various out-patient departments, and in certain affiliated institutions. Operations are performed on every afternoon of the week except Saturday. Special limited classes are arranged in gynæcology, the surgical diseases of children, including orthopædic surgery, diseases of the throat, nose, and ear, diagnosis of diseases of the chest, diagnosis of diseases of the nervous system, ophthalmoscopy and refraction, analysis of gastric contents, clinical examination of the blood, diseases of the skin, abdominal surgery, radiography, bacteriology (which is accepted by the University of Cambridge for its D.P.H. diploma), and medical electricity. The fee for a three months' course of study, which may be begun at any time, in any single department, is one guinea. A fee of three guineas admits to the whole practice of the hospital for a similar term (one month two guineas), and a perpetual ticket for the practice of the hospital may for the present be obtained on payment of a fee of five guineas. Medical practitioners who have attended a three months' course in any department are eligible for appointment as clinical assistants in those departments. A certificate, signed by the staff, may be obtained at the end of three months' hospital attendance. A pathological museum and a pathological laboratory for original research are available. A reading- and a writing room, containing a reference and lending library, is provided, and tea may be obtained. The hospital is connected with the Telephone Exchange (No. 23, Tottenham).

The lecturers are as follows:—In General Medicine: Dr. Percy Kidd, Dr. R. Murray Leslie, Dr. G. P. Chappel, Dr. A. J. Whiting, Dr. A. G. Auld, and Dr. T. R. Whipham. In General Surgery: Mr. John Langton, Mr. Walter Edmunds, Mr. H. W. Carson, and Mr. J. Howell Evans. In Gynæcology and Obstetrics: Dr. Arthur Giles. In Diseases of the Eye:

Mr. R. Philip Brooks. In Diseases of the Ear, Throat, and Nose: Mr. H. W. Carson. In Diseases of the Skin: Dr. G. Norman Meachen. In Fevers (at the North-Eastern Fever Hospital, St. Anne's-road): Dr. Frederic Thomson. In Diseases of Children: Dr. G. F. Still. In Diseases of the Chest (at the Mount Vernon Hospital and the Northwood Sanatorium): Dr. J. E. Squire. In Psychological Medicine (at the Colney Hatch Asylum): Dr. S. J. Gilfillan. In Tropical Medicine: Mr. James Cantlie. In Radiography and Medical Electricity: Dr. A. Howard Pirie. In the Administration of Anæsthetics: Mr. A. de Prendcrville and Dr. F. H. Wallace. In Pathology and Bacteriology: Dr. G. G. Macdonald. In Clinical Pathology and Bacteriology: Dr. Basil Price.

The opening lecture of the winter session, in conjunction [illegible] Clinical Society, will be [illegible] Oct. 7th by Mr. J. Bland- [illegible] prospectus and syllabus of lectures and demonstrations, may by obtained from the Dean of the School, Dr. A. J. Whiting, at the Hospital or at 142, Harley-street, London, W.

(To be continued.)

Medical News.

FOREIGN UNIVERSITY INTELLIGENCE.—*Strasburg:* Dr. Erich Meyer, *privat-docent* of Medicine in the University of Munich, has been offered an Extraordinary Professorship with the Directorate of the Medical Policlinic; Dr. Hans Dietlen, assistant in the University Medical Clinic, has been recognised as *privat-docent* of [illegible] ocent [illegible] ssor; [illegible] t of [illegible] has [illegible] Dr. [illegible]

AT the following five pottery towns, Burslem, Stoke, Longton, Newcastle-under-Lyme, and Fenton, ophthalmia neonatorum has been added to the list of compulsorily notifiable diseases.

THE chairman of the Hospital for Sick Children, Great Ormond-street, has announced that the profits of the Midsummer Fair and Fête recently held on behalf of that hospital, together with the subscriptions received on that occasion, amounted to £5387, but that the hospital still owes £5500 advanced by its bankers for current expenses.

MEDICAL EDUCATION AND THE SONS OF MEDICAL MEN.—As the question has been asked us more than once whether the sons of medical men entering the medical schools of the various London hospitals are granted any rebate on their fees, we think it may interest intending medical students and their parents to know how the matter stands. There is no such general principle recognised at the London schools as the admission of medical men's sons upon more favourable terms than others for several quite good reasons. We need only mention one, which is that whatever may be the case now, in the past the choice of medicine for a profession has often been due to family [illegible] men in certain [illegible] medical men [illegible] heir fees would have amounted to almost a general cheapening of the cost of medical education. At present medical education at the London schools is conducted at great pecuniary disadvantage, and at many of the institutions the instruction of the students is undertaken practically gratuitously by the medical staff, and this may account for the grant of special terms to sons of medical families at so few of the schools. A few scholarships founded on the lines suggested by those of our correspondents who have inquired whether the sons of medical men could not be educated more cheaply than the sons of laymen would undoubtedly prove of value. So far as we know, the only medical schools which grant any special facilities at present are Charing Cross, where a Huxley Scholarship which is only open to the sons of medical men has been established; St. Bartholomew's, where there is a scholarship for the best pupil of the year who has received his education at Epsom College, the recipient often being the son of a medical man; London, where a reduction of fees is made to the sons of medical men; and Westminster, where a reduction of the composition fee is made to the sons of medical men who have not already at the time of entry won a scholarship. In exceptional circumstances the councils of most of the London Medical Schools would, no doubt, consider any particular case where a reduction of fees seemed desirable on its merits.

THE DEATH OF DR. HENRY RADCLIFFE CROCKER.—We deeply regret to announce the death of Dr. Henry Radcliffe Crocker, the well-known dermatologist, and physician to the Skin Department of University College Hospital, which took place in Switzerland on Sunday last, August 22nd, the sad event occurring suddenly. Dr. Crocker, of whom we shall publish a more detailed obituary notice, was the author of some admirable writings on his subject, while his pen was laid under contribution for such first-class compendiums as "Quain's Dictionary of Medicine," "Heath's Dictionary of Surgery," and "Allbutt's System of Medicine" This Journal has lost in Dr. Crocker a personal friend, for he was for many years a regular contributor to our columns.

PARLIAMENTARY INTELLIGENCE.—ABANDONMENT [illegible] will not proceed with [illegible] dairies this session. [illegible] withdrawn and the corresponding measure for Scotland, which has been before the House of Lords, will not be proceeded with further. The announcement of the decision of the Government was made on August 20th in the House of Commons by the Prime Minister, who, in accordance with the usual custom at this stage of a session, indicated the measures which, owing to lack of time, would have to be dropped. The inclusion of the two Milk Bills amongst the "massacred innocents" has not occasioned much surprise. The Milk and Dairies Bill for England had not even reached a second reading, and as the weeks of the session passed without any attempt being made to advance it, its prospects of becoming law this year diminished. The recent debate on the Scottish Milk Bill in the House of Lords showed that there were considerable Parliamentary obstacles in its path. At the same time, it must be recorded that in many quarters at Westminster disappointment, not to say dissatisfaction, exists at the shelving of these Bills.

POST-GRADUATE LECTURES IN THE UNIVERSITY OF VIENNA.—Of late years a series of post-graduate lectures [illegible] has been delivered at the [illegible] Vienna during the vacation [illegible] October, and the results have [illegible] now been decided to make them a permanent institution. As in former years, a course may either extend over a period of four weeks or may consist of 24 attendances of one hour each. In order to ensure the maximum benefit for those attending such classes none of them will consist of more than ten members. As during summer time no clinical lectures are delivered and the professors are generally away for their holidays, a large amount of clinical material can be used by the lecturers for purposes of illustration. The fees for such classes vary from £3 3s. to £5 5s. Special care is taken to arrange such courses as will be found most useful by practitioners desirous of bringing their knowledge up to the present standard. The important subjects of anaphylaxis, serotoxicology, operative surgery, biology, bacteriology, vaccine therapy, electro-therapeutics, and hæmatology are therefore well represented in [illegible] Many of these [illegible] numerous courses being held [illegible] ves of the Englishmen and Am [illegible] for these opportunities thus [illegible] already far in excess of the number of vacation classes are places available. The last courses usually take place in September, but this year an extension to October will no doubt be necessary

DEATH.

GRANGER.—Suddenly, at a Nursing Home, Leeds, on August 22nd (of appendicitis), Henry Maxwell Granger, M.B., Ch.B., aged 23, youngest son of the late Dr. John Ross Granger, of 2, Grosvenor-terrace, Glasgow.

OUR CURRENT NUMBER

Being almost exclusively devoted to information especially interesting to Students we are necessarily compelled to defer the publication of communications on other important subjects.

We tender our best thanks to those gentlemen who have at considerable personal trouble kindly supplied us with the returns and prospectuses upon which the information given in this Students' Number of THE LANCET *relative to the various medical examining bodies, hospitals, and medical schools of the United Kingdom is based. We regret that in some cases, however, owing to proofs having been either not returned at all or too late, certain inaccuracies may be found.*

TO ADVERTISERS.

Owing to the pressure on our advertisement columns this week some announcements have unavoidably been held over.

◆

T. C.—We of course noticed the character of the English but we think that the illiteracy hardly required indication from us.

Communications, Letters, &c., have been received from—

A.—Dr. J. Aitken, Kilmarnock; Dr. J. D. Albright, Philadelphia; A. D.; Dr. J. E. Adams, Lond.; Sir T. Clifford Allbutt, Vermala-s.-Sierre; Ashton-under-Lyne Union, Clerk to the; Messrs. Allen and Hanburys, Lond.; Dr. Z. Abdalla, Paris; Anglo-American Pharmaceutical Co., Croydon.

B.—Mr. J. A. Barth, Leipsic; Dr. W. F. Barnes, Halifax, Nova Scotia; Sir W. Bennett, Lond.; Board of Education, Lond.; Major B. D. Basu, I.M.S. [illegible] Executive Health Officer of; Mr. A. A. Bradburne, Southport.

C.—Mr. J. Jackson Clarke, Lond.; Messrs. Cassell and Co., Lond.; Mr. W. Clark, Edinburgh; Dr. T. Carruthers, Kilbarchan; Casein, Lond., Director of; Mr. H. A. Collins, Croydon; Messrs. T. Cook and Son, Lond., Messrs. J. and A. Churchill, Lond.; Colonial Office, Lond.; Mr. James Cantlie, Lond.

D.—Messrs. Down Bros., Lond.; Dr. A. Duncan, Lond.; Mr. H. V. McMahon Dillon, Dublin; Lieutenant-Colonel G. W. P. Dennys, I.M.S., Peshawar; Dr. Clement Dukes, Rugby; "Dr.," Bristol; Dewsbury and District General Infirmary, Secretary of; Derbyshire Royal Infirmary, Derby, Secretary of; Dr. J. F. Gordon Dill, Brighton; Mr. Heerjee J. Dadysett, Bombay.

E.—Messrs. Eason and Son, Dublin; Enquirer.

F.—Messrs. Ferris and Co., Bristol; Dr. P. Fusco, Rome.

G.—Messrs. Gale and Co., Lond.; Great Yarmouth Hospital, Secretary of.

H.—Mr. A. H. Hudson, Lond.; Mr. E. Douglas Hume, Lond.; Dr. George Hall, Newcastle-on-Tyne.

I.—India Rubber, Gutta Percha, and Telegraph Works Co., Lond.; XVIth International Medical Congress, Budapest, Chief of the Press Office of; Incorporated Institute of Hygiene, Lond., Secretary of; *The Irish Law Times and Solicitors' Journal*, Dublin, Editor of.

J.—Staff-Surgeon A. H. Jeremy, R N., Bournemouth; J. M. B., Messrs. W. and A. K. Johnston, Edinburgh; J. S.

K.—Dr J. R. Kaye, Wakefield; Mr. T. J. Kelly, Enniscorthy; Dr. Knight, Portobello; Dr. J. Knott, Dublin.

L.—Dr. R. A. Lyster, Winchester; Captain A. E. J. Lister, I.M.S., Meerut, Leeds Public Dispensary, Secretary of.

M.—Mr. W. F. Menzies, Leek; Mr. Jack McCloy, Glasgow; Messrs. May, Roberts, and Co., Lond.; Messrs Macmillan and Co., Lond.; Messrs. Meister, Lucius, and Bruning, Hoechst-a.-Main; Major R. H. Maddox, I.M.S., Darjeeling; Macclesfield General Infirmary, Secretary of; Messrs. Masson et Cie, Paris; Mr. H. C. MacBryan, Box; Mr. E. Merck, Lond.

N.—Mr. S. Nelmes, Hamilton, Bermuda.

O.—Oldham Union, Clerk to the; Messrs. Osborne Peacock Co., Manchester.

P.—Mr. R. J. Pritchard, Lond.; Mr. Norman Pollock, Northfield; Mr. D'Arcy Power, Lond.; Painswick Sanatorium, Resident Physician of; Messrs. Pratt and Co., Manchester.

An Address

ON

CANCER IN MAN AND ANIMALS.

Delivered before a General Meeting of the Sixteenth International Medical Congress, Budapest, September, 1909,

By E. F. BASHFORD, M.D. Edin.,

DIRECTOR, IMPERIAL CANCER RESEARCH FUND, LONDON.

A complete change has been effected in many aspects of the cancer problem during the past seven years, and I propose to give you some account of the share the Imperial Cancer Research has had in effecting it. The extent of the ground I shall have to cover must be my excuse for the imperfect references I shall make to the valuable work of investigators in other centres of active investigation of [illegible] longer commence with the [illegible] limited to the white man and, in consequence of his transmitting it, to races living under the circumstances peculiar to his particular form of civilisation, and to his domesticated animals. On the contrary, the liability to cancer of all races of mankind and of all vertebrates, even when living in natural conditions, has been established as a fact from which all attempts to explain the disease must start. Whilst all claims to have transferred cancer experimentally previous to 1900 had either broken down before the criticism that the lesions adduced to substantiate the claim were not the lesions of cancer, or, as in the case of Hanau and Morau, had been received with scepticism, from lack of confirmation, the experimental reproduction, at will, of the lesions of carcinoma and sarcoma has to-day become a matter of mere laboratory routine. I shall attempt to show you that these two achievements have established the investigation of cancer upon a sound comparative biological and experimental basis; further, that they have done away with the stagnation of thought and with the pessimism pervading the minds of the scientific public at the close of the nineteenth century. Under their auspices rapid progress has been made in defining more narrowly both the nature of the disease and the direction in which its ultimate explanation will be found.

Although the immediate consequence has been the possibility of conducting a multiplicity of highly specialised investigations, and although no revolutionary generalisation on the etiology or on the prevention and treatment of cancer is yet possible, still that steady advance in knowledge which the successful application of the experimental method has always foreshadowed in other paths of human endeavour may be anticipated also in the case of cancer. So much is certain, whether a chance observation appreciated and followed up with genius may lead to a sudden and unexpected relief of human anxiety and suffering it is impossible to foresee, but the ever-increasing army of experimental investigators augurs well for so important a chance opportunity not being missed should it present itself.

Survey of the Incidence of Cancer in Vertebrates.

The experimental studies of the Imperial Cancer Research have been coördinated from their inception in September, 1902, with the study of the natural incidence of the disease in all races of mankind and throughout the vertebrate kingdom. Reference made to the Japanese statistics shows that instead of being rare in that country cancer claims 25,000 victims a year, and an analysis of the Indian hospital figures indicates such close similarity in its pro[illegible] different parts of the body that it is [illegible] general incidence of the [illegible] and. Vegetarian castes in India are no more exempt [illegible] indulging in a mixed diet. [Slides were here shown of congenital glio-sarcoma of the orbit from West Africa, of scirrhus of the breast from the Sudan, of epithelioma of the lip in a Dinka from the White Nile, and of an osteo-chondro-sarcoma from Northern Nigeria. [illegible] then seen to be susceptible no evider[illegible] of epidemic [illegible] nal races wh[illegible] in Europear[illegible] in mammals and the lower vertebrates was illustrated by lantern slides of growths from [illegible] and fishes; and carcinomata of [illegible] were shown from the frog, trou[illegible]

Our earliest contributions to the experimental study of [illegible] that the disease [illegible] the results of Ehrlich [illegible] of recognised authority in England and Germany appeared to us both inexplicable and unjustified. In the light of our comparative experience it would have been strange indeed if the mouse had proved to be exempt from cancer. Orth has recently written: "There occur in mice tumours which, although not identical in every respect with human carcinomata, nevertheless, exhibit so many points of similarity with the latter, that it appears correct to designate them as carcinomata of the mouse, and to apply the observations made on them to human pathology with the precautions necessary in all experimental and comparative pathological investigations." This statement by Orth, conceding all we have ever contended for, marks the end of any serious opposition on the part of pathologists of authority to the experimental study of cancer.

It has been too often wrongly asserted that the mouse [illegible] of the mamma. I illustrate the [illegible] her forms of malignant new growths by a [illegible] slides from specimens in our collection of carcinoma of the stomach, small intestine, pancreas, ovary, [illegible] gland, preputial glands, also of sa[illegible] melanoma, and [illegible] described squamous-celled [illegible] mouth and lympho-sarcoma; Haaland has described squamous-celled carcinoma of the vulva and adeno-carcinoma of the lung, as well as chondro-sarcoma of the vertebral column. Ehrlich has described a chondroma probably of congenital origin; carcinoma of the uterus has been recorded from Buffalo; Tyzzer has described papillary cyst-adenoma of the lung, cyst-adenoma of the kidney, and lympho-sarcoma; Jobling has recorded spindle-cell sarcoma on chest wall (? mamma) and papillary cyst-adenoma of the ovary. The great liability of the female mouse to cancer of the mamma is merely an idiosyncrasy shared with the human female and the female dog.

I show you some histological pictures of typical adeno-carcinoma and alveolar-carcinoma of the mamma of the mouse, and exhibit several figures of mice showing primary growths and their metastases in the lungs and lymph glands. The clinical course, the results of surgical or other treatment, the pathological findings, and the relation to general metabolism have been carefully recorded in our laboratory for over 300 mice suffering from malignant new growths of the mamma. On a lantern slide has been grouped the clinical course of a few cases of carcinoma of the mamma, illustrating well their liability to recur after complete surgical removal has been attempted, and the fatal termination in consequence of dissemination or terminal cachexia. The observations agree with medical, surgical, and pathological experience in the human subject, and demonstrate how secure is the basis they afford for attempts to apply the results obtained by studying the disease in mice to the disease as it occurs in man. The main danger of the disease lies [illegible] it in a stage permitting comp[illegible] ipating dissemination [illegible] relief surgery can give is shown by the absence of [illegible], or of metastases, for months after removal of the primary growth. That the period of relief may equal one-third of the total life of the mouse justifies, and experimentally demonstrates, the value of the surgical treatment of the disease in man, so long as there remains no alternative to it. Convenience and questions of expense have led to the experimental investigation of cancer being developed on the basis of experience gained, for the most part, on mice, although the rat, dog, and other larger mammals have been employed by us to a less extent.

---

[1] Full references to the work of others will be found in the publications of the Imperial Cancer Research—e.g., in the Third Scientific Report, 1908. Taylor and Francis, Red Lion Court, Fleet-street, London, E.C.

EXPERIMENTAL REPRODUCTION OF THE LESIONS OF CANCER.

For two years it looked as if the experimental study of cancer was going to break down once more in face of the criticism that the lesions of the disease, as it occurs naturally, were not reproduced experimentally. By a suitable technique it is now possible to reproduce all the esions of cancer experimentally—local infiltration, systemic dissemination, and the terminal cachexia.

After some preliminary controversy it is now agreed that nfection plays no part in the experimental transference of cancer, which is a true transplantation of living cells. The ntroduction of a particle of living tissue by means of a hypodermic needle does not reproduce the anatomical relations obtaining when normal cells become cancerous, and there would have been nothing to cause surprise had the cancer *cells continued to grow only* at the *site of* inoculaion; indeed, notwithstanding the demonstration which we gave in 1905, so little surprise was aroused in the minds of some experimenters at their failure to reproduce the lesions of dissemination, that Ehrlich in 1906, n setting up the doctrine of atrepsy, relied, to a large extent, on the assumption that their absence was of fundamental moment, and due to the tumour at the site of noculation so withdrawing the food-supply as to prevent its off-shoots from establishing themselves in distant organs. The absence of metastases is due for the most part to technical details in the procedure of inoculation and to the duration of the growth of the resulting tumour. The reproduction of the lesions has become in our experience a commonplace of laboratory routine. A survey of the facts on the experimental reproduction of the lesions of cancer, affords a demonstration of the adequacy of Ribbert's view, that all the lesions of the disease as it is exhibited in man, may be the consequence of the continued growth of cells which primarily were confined within a small circumscribed area.

THE "AGE-INCIDENCE" OF CANCER AND THE EXPERIMENTAL DISTINCTIONS BETWEEN YOUNG AND OLD MICE.

The investigations of the Imperial Cancer Research have settled once and for all that cancer is a disease common to mankind throughout the world and to vertebrates. The illustrations I have shown you demonstrate clearly how closely the primary lesions of the disease resemble one another, even when occurring in animals so remote as man and fish. There is, however, another common and even more striking feature of the disease. Its peculiar association with certain periods of life in man, known as the "age-incidence" of cancer, reveals a law applicable to all vertebrates. A demonstration of its validity for the mouse is given by the following table showing the liability of the female mouse to carcinoma of the mamma at different age-periods:—

	6–9 months.	–12 months.	–15 months.	–18 months.	–21 months.	–24 months and over.
Total... ...	135	110	94	21	6	—
Cancer ...	3	4	7	3	2	—
Per cent....	2·2	3·5	7·4	14 2	33·3	—

The progressive increase shown in the table presents a remarkable parallel with the age-incidence of cancer of the mamma in the human female shown in the next table, and also adds a statistical confirmation to the results of our comparative histological and biological studies, which have shown the close parallel, amounting in many particulars to complete identity, between malignant new growths in man and other vertebrates. The above table demonstrates that the law of the age-incidence of the disease holds for the shortest-lived mammals as it holds for man. Since the less perfect data for other vertebrates are in complete accord with the facts established for mankind and for mice, the general application of the law of age-incidence is probable, and therefore any explanation of the etiology of cancer must accord with the circumstance that when considered *statistically* cancer is a function of age, and when considered *biologically* a function of senescence. The main condition for discovering a considerable number of cases in civilised and in savage man, in mammals, and in vertebrates generally is the examination of a sufficiently large number of adult and aged individuals.[2] The law of the age-incidence

[2] The time of onset of cancer in developmental anomalies is probably a manifestation of the validity of the law of age-incidence for abnormal organisms and organs.

of cancer is of fundamental etiological and general biological importance. It applies both collectively and individually to the organisms of a species as well as to their individual organs and tissues, as shown for man by the curve (Fig. 1) of the age-distribution of cancer in hospitals, all cases having been examined microscopically, and by the table giving an analysis of the age-incidence of cancer for different organs in the general population.

Many aged persons escape cancer, which it must be distinctly pointed out is not caused by old age, for senescence, whether constitutional or confined to circumscribed areas of tissues, is only an endogenous predisposing factor.

At the commencement of the experimental study of cancer it was quite natural that old animals should be selected for inoculation purposes. We speedily found, however, that they are much less suited for the transplantation and growth of cancer than are young animals, as the following two charts show. The first chart (Fig. 2) illustrates the growth of our tumour "63" in three groups of mice, young, middle-aged, and old. You will notice a progressive diminution in the number of tumours developing as well as in their respective rates of growth. Tumour "63" shows itself less susceptible to differences due to age than are other tumours, as illustrated in the second chart (Fig. 3) for tumour "32," where you will notice the same progressive diminution in the number of tumours and in their rates of growth, according as inoculation was made into young, middle-aged, or old mice. Indeed, progressive growth did not take place in a single old mouse. At the end of four weeks all the old mice had cured themselves of the tumours "32." Such observations enabled Murray and myself to analyse some of the relations obtaining between the origin and the growth of cancer. In the first place they agree with the more rapid growth observed in the human subject, when cancer develops in young people. They also demonstrate that, while senescence is intimately associated with the inception of cancer, it is not necessary for its continued growth, and therefore the origin and the growth of cancer may be considered separately. I shall have to revert later to the respective parts played by the localised tissue changes and the constitutional conditions associated with the natural development and the growth of cancer. What is studied in the transplantation of cancer is the ability of tumour cells to establish themselves in new hosts and their powers of continued growth. In order to obtain uniform results great care must be taken to secure animals of uniform age. Old age of itself suffices to render mice absolutely resistant to the inoculation of cancer. As the second chart shows with clearness, the fact that the cells are able to establish themselves does not necessarily mean that they will be able to continue to proliferate, and later I shall demonstrate to you that growth is frequently terminated by the immunity which the tumours induce against themselves. The difference between inoculating tumours into young and into old mice is of great technical moment in the interpretation of experiments on immunity, as is evident from the charts I have just exhibited. No conclusion can be drawn from experiments bearing on the artificial induction of immunity or resistance to the inoculation and growth of cancer if this factor alone, or together with others to be mentioned later, has been neglected or not adequately allowed for. This is unfortunately the case in all experiments except those conducted in our laboratory. I shall have to refer to this fact again when discussing whether the resistance which can be induced by tumour tissue and by normal tissue is specific or general in its nature.

THE ALLEGED INCREASE OF CANCER.

It follows from what has been said above on the statistical importance of the age-incidence of cancer that very full attention must be given to the relative numbers of the population in different age periods, whenever any attempt is made to appraise the frequency of cancer. The problem of the relative frequency of cancer in this or that population and area overlaps the much-discussed question of *its alleged* increase. Savage races are unsuited for the *study of both* these problems and also for the investigation of the *relative* liability of *different sites of the body*. By the time the natives of Central Africa have so organised their communal life that reliable vital statistics are forthcoming the conditions of life among them will no longer be what they are to-day, and no doubt they will be interested in what to them may be a new problem, "the alleged increase of cancer." We have seen this stage reached at successive intervals in different countries with the progressive improvement of their national statistics, and since the work of the Imperial Cancer Research was started Europeans have passed from the belief that cancer was rare or did not occur, for example, in Japan, India, and Egypt, to the minor questions of its relative frequency, or its real or apparent increase in those countries.

It may be added that when our investigations were commenced and the determination come to in September, 1902, to study cancer in animals, doubts were expressed by some as to whether the difficulty of finding a sufficient number of cases would not prove insurmountable. The large number of cases of cancer (over 1000) which have been observed in mice by various investigators during the past six years does not mean an increased liability of mice to cancer, but simply that it has been looked for with care in a sufficiently large number of adult and aged animals, and found. The increase in the number of cases recorded throughout the vertebrates has the same significance.

The number of deaths assigned to cancer has increased from year to year in practically all countries. This increase is made to appear most alarming when it is taken up as a national problem—e.g., in England, Germany, or the United States—without due regard to the universality of the phenomenon. When due regard is paid to its universality in man and in animals, to the varying value of the data used for statistical purposes in different countries, and, in the same country at different times, as well as to the varying accuracy of the statistical methods employed, I very much question if those persons who have made exaggerated statements to the effect that the recorded increase of cancer represents a true and relatively increased liability to it, have any excuse whatsoever *for enhancing the reasonable anxiety* of the lay public.

Without digressing into a discussion of the statistics of cancer, I would point out that the number of deaths assigned to it as a cause of death increases from one country to another parallel with the increasing accuracy of the vital statistics of the several countries, as the following table from the report of the Registrar-General shows:—

Cancer Death-rates per 1000 Persons Living, 1881–1907.

Countries (arranged in order of rates in 1901–1905).	Quinquennial periods.					Years.	
	1881–1885.	1886–1890.	1891–1895.	1896–1900.	1901–1905.	1906	1907.

* Four years. † Three years.

The recognisable sources of fallacy in the data on which the above table is compiled and in the institution of comparisons between the cancer death-rates in different countries carry more weight with accurate statisticians than the differences existing between the figures for different countries. The differences between different countries which the table shows reproduce also the various stages through which the statistics of single countries have passed in the course of their development, and the same reasoning makes obvious their dubious value as evidence that the differences in the statistics of the same country at different times reveal real differences. Passing over statistical methods, I would point out that out of 10,532 cases of cancer treated in hospital—i.e., under the most favourable circumstances for diagnosis—1801 were not diagnosed as cancer from clinical evidence alone. Out of 9488 cases treated as cancer, 757 were not suffering from the disease. The following table illustrates the relative proportions in which the disease was diagnosed in different sites of the body according to their accessibility to complete physical examination:—

Analysis of the Cases of New Growths Reported by the Hospital Authorities (Microscopical Examination has been made in all Cases), 1904–09, all Ages.

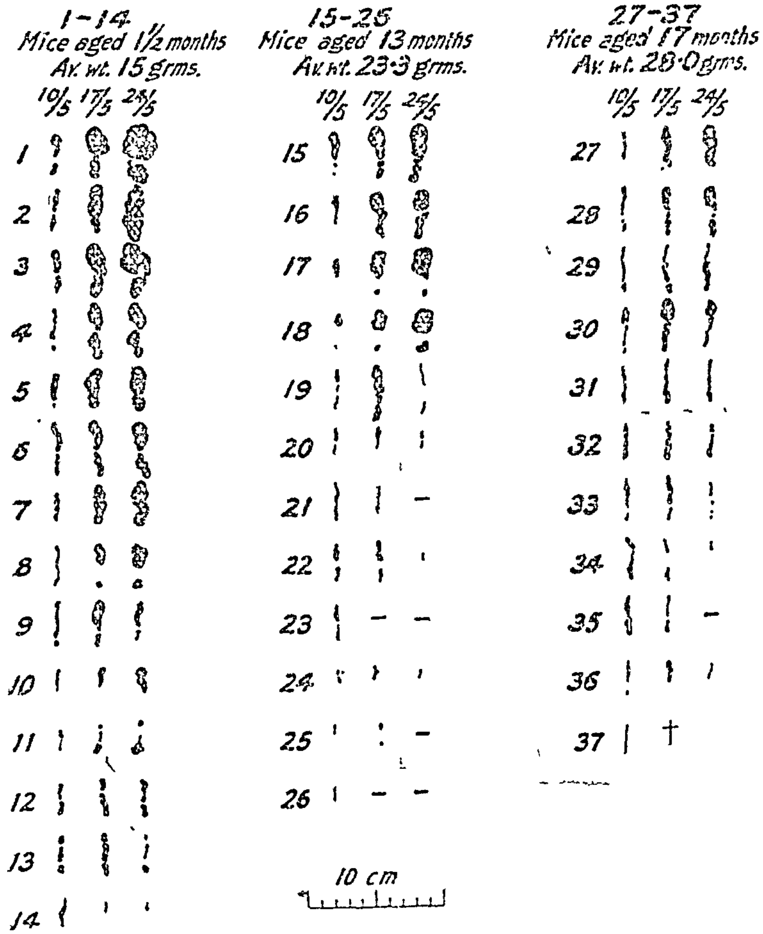
FIG. 2.



Comparison of suitability for growth of transplanted carcinoma (tumour "63") of mice of different ages, 1½ months (1-14), 13 months (15-26), and 17 months (27- with dose 0·05 cc and 24th. The n 37 mice in 10, ..

The errors of diagnosis in general practice are probably not less than in hospitals, although, of course, no direct comparison is possible between hospital patients and the general population. I need not enlarge upon the possibilities of improving the diagnosis of cancer in savage races and in animals, but it may be well to point out that the opportunities for their reaching cancer ages in large numbers are absent in many instances. The greater frequency of cancer in domesticated as compared with wild animals appears to be due, as we pointed out in 1903, not to contact with man, but to the fact that man so provides for and protects them that higher proportions live long enough to attain to their respective cancer ages.

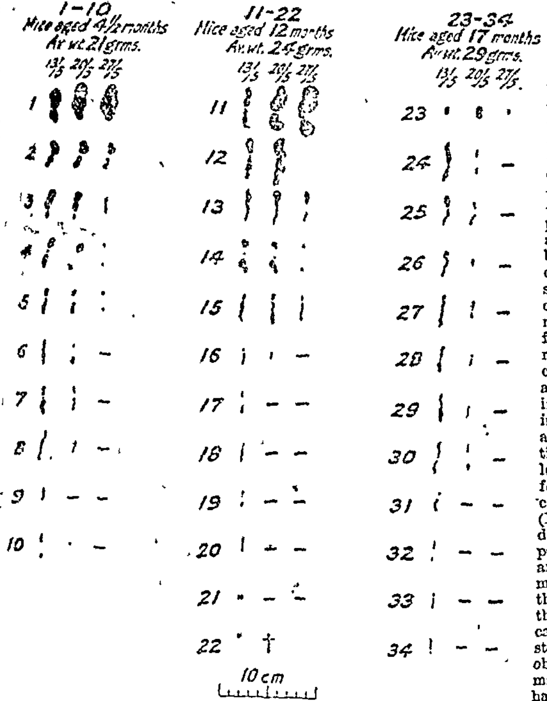
In recent years the attempt has been made to advance the statistical study of cancer, not by enumerating the numbers of those *dead* from it, but by making a census of persons *suffering* from it. The difficulties are greater in telling if a person is suffering from cancer than in determining if he died from it. The method is as fallacious statistically as is reliance on hospital statistics in order to adduce evidence of the increase of cancer. The collection of the clinical and pathological data from hospitals given in the above table has demonstrated that the taking of a census of cancer patients in the general population is an absolutely worthless tabulation of data vitiated by an exaggeration of all the fallacies inseparable from data of mortality. An improvement in the value of the statistical investigation of cancer is only to be expected from an improvement in mortality statistics as a whole—i.e., by an increase in the accuracy of all the data on which vital statistics are necessarily based. The necessity for greater completeness, uniformity, and accuracy of the data of mortality, and of those relating to the age-constitutions of populations, applies still more urgently if comparisons are to be made between the statistics of cancer of different countries. Comparisons between different countries will only be made profitable by an all-round raising of the standards of accuracy and completeness of vital and mortality statistics. For these and other reasons a cancer census has not been made in England. Where one has been made—e.g., in Germany, Holland, Hungary, and Spain—it has left all the problems of cancer just as they were. For these reasons we also consider the attempt to compile uniform international cancer statistics a counsel of perfection, and a Utopian scheme diverting both energy and money from other and more profitable lines of investigation.

There is no doubt that an absolute increase of the number of cases of cancer *recorded* from year to year is taking place not only in practically all races of mankind but also in vertebrate animals. Nevertheless, to alarm the public by proclaiming this as "an increase of cancer" in the sense that there is an increase disproportionate to the numbers and age-constitution of the populations examined is pure sophistry. Much of this increase can be referred with certainty to the larger number of individuals attaining to the "cancer age." Another considerable proportion can be referred with equal certainty to greater care in searching for the disease, as demonstrated for many native races and for animals. The universal endeavour to improve vital statistics in all countries is also in part responsible. Reviewing the whole circumstances, one must concede that these factors have been potent ever since statistics of any kind were available, and although it is impossible to deny that a relatively greater proportion of the population may die from cancer than previously was the case, nevertheless a real increase cannot be proved, and what has been made a cause of public anxiety appears to have little or no existence in fact.

THE INCIDENCE OF CANCER ON DIFFERENT PARTS OF THE BODY.

In considering the etiology of cancer regard must be paid to the site of predilection. According to the national mortality statistics

FIG. 3.



Comparison of suitability [illegible] cinoma (tumour "32" [illegible] months (11-22), and 17 [illegible] lated in right axilla [illegible] examined on May 13th, 20th, and 27th. The chart shows the relative sizes of the tumours attained in 34 mice in 10, 17, and 24 days after inoculation respectively.

of England and Wales, among males the organ most frequently invaded is the stomach; it is the seat of the disease in nearly 22 per cent. of the fatal cases, the liver and gall-bladder are invaded in nearly 13 per cent. of the whole, the rectum in 10 per cent., and the intestine in 8 per cent. Taken together, the parts here specified are attacked in more than two-fifths of the total cases recorded in the national mortality statistics. Among females the generative and mammary organs are affected in more than two-fifths of the total fatal cases; while a further two-fifths are contributed by the stomach, liver, intestines, and rectum, taken together. It is well known that cancer is more fatal to women than to men, and that this fact is accounted for [illegible]

but also the important differences, which obtain between the general population and a hospital population. In the latter all cases have been examined microscopically. One important difference is of interest—the maximum for the fatal cases in the general population occurs between 55 and 65, or ten years later than in hospital patients. This difference is partly accounted for by the duration of the disease from the time it is observed till the fatal issue, but is also to some extent an expression of the beneficial effects of surgical treatment by postponing death till the patients fall under the next decennial age-period. I need not do more than allude to sources of fallacy if any attempt be made to magnify the importance of the differing maxima.

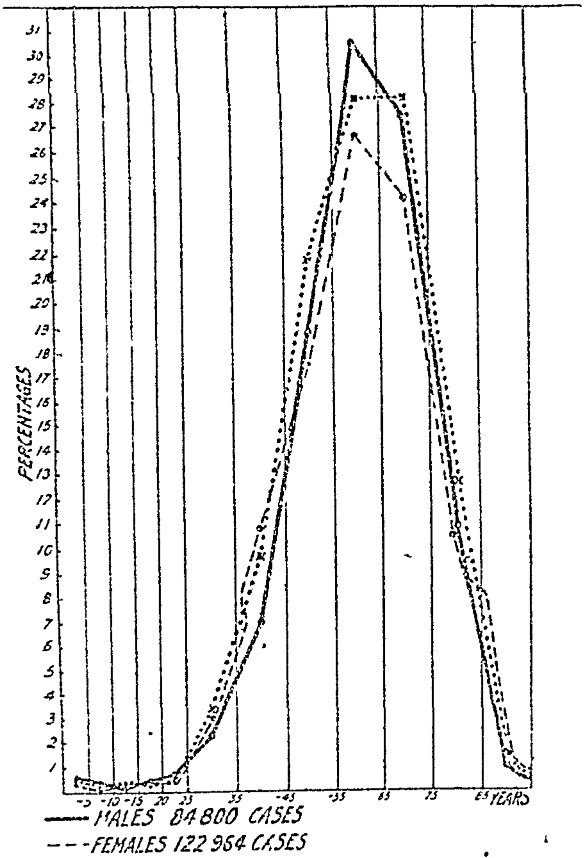
In England and Wales in the seven years ending with 1907 the recorded deaths of males from malignant disease other than that of the generative and mammary organs were equal to a rate of 730 per 1,000,000, whilst the deaths of females with the same reservation did not exceed 594 per 1,000,000, the total deaths from all forms of cancer being 84,800 males and 122,964 females. Therefore, when other individual organs are considered, there is an opposite contrast between the two sexes—e.g., cancer of the lip, tongue, œsophagus, stomach, and rectum is much more common in men than in women, but in women cancer of theg all-bladder and liver is perhaps more common than in men. On the whole, the liability of males, both generally and for individual organs—excluding the generative and mammary organs—is greater than that of females, and it appears possible that the difference is due not merely, if at all, to constitutional conditions determined by sex, but also by local circumstances peculiar to the organ attacked, perhaps by the customs of the two sexes, in the same way as the difference in the customs of women in India and in Europe determine their respective liability to, and exemption from, carcinoma of the mouth. I shall have to refer later to the enhanced importance thrown by comparative and experimental studies on the association of cancer of the skin with chronic irritation, and I may allude here to its possible importance also in connexion with cancer of the alimentary tract. The difference in the proportionate incidence of cancer on the upper and lower halves of the alimentary canal in males and females respectively, is brought out diagrammatically by curves for the population generally (Fig. 6) and for hospital patients (Fig. 7). The details lacking for different sites for the general population are available for hospital patients and may be cautiously employed to elucidate the mortality statistics. The curves of liability for the two sexes cross at the stomach in both, so that for males a higher proportion of cases of cancer of the alimentary canal occur above the stomach than below it, the opposite relation obtaining for the female sex. This relationship may be brought into connexion with the different habits of the two sexes, in consequence of which the upper part of the alimentary canal is more exposed to chronic irritants in males and the lower part in females.

The predilection for some sites rather than for others in mankind, and even the preponderance of certain forms of cancer in a single organ—e.g., scirrhus carcinoma of the breast in the human female—must be considered from another standpoint than that of chronic irritation. These sites of predilection reveal the existence of endogenous factors associated with cancer, when considered in the light of comparative investigation. In surveying the incidence of cancer in the vertebrate kingdom one has been struck by the fact that certain forms appear to preponderate in different classes—e.g., carcinoma of the thyroid in the trout. In the mammalia some species are very liable to forms of cancer of the mamma from which others, even nearly allied, are relatively or altogether exempt. Cancer of the mamma is extremely rare in the cow, common in the human female, the dog, and the mouse. In the animals liable to cancer of the mamma the disease exhibits specific characters in the relation between the epithelial and connective tissues—e.g., scirrhus in the human female; delicate stroma and great tendency to dilated blood sinuses and to hæmorrhages in the mouse; in the dog tendency of the connective-tissue scaffolding to the *formation* of cartilage and bone; in the rat to the *formation of dense* sclerotic tissue as in the human female. When fuller facts are available it will probably be found that the sites of election do really vary from one class or even nearly related species of animal to another. Since external conditions—e.g., chronic irritation—and modes of life cannot be made entirely responsible for the differences, they can be referred with some certainty to innate peculiarities of the several different mammalian organisms, predisposing certain organs to, or exempting them from, cancer, and determining even the type of [illegible] in an organ—e.g., the [illegible] It [illegible] to escape concluding that these differences justify the assumption that distinctive inter-relations exist between malignant new growths of the same organ in different species—e.g., the mamma—and the entire organism. We are thus brought face to face with local and constitutional conditions associated with cancer, and when we come to compare differences in the incidence of cancer in individuals of the same variety of a species we are tempted to assume an innate, or an acquired local, or constitutional predisposition in one case and exemption in another.

CHRONIC IRRITATION AND CANCER.

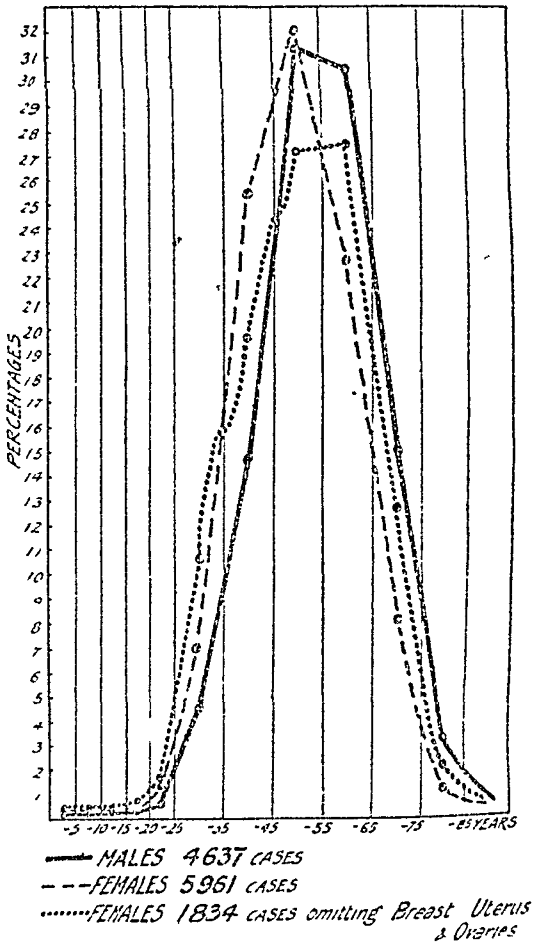
Since no race of mankind is exempt, the association of cancer with forms of chronic irritation[3] having nothing in common beyond their liability to produce chronic ulceration, chronic inflammation, or prolonged attempts at repair, is a fact of more moment than any futile discussion of the relative liability of different races of mankind. Carcinoma of the skin of the abdomen is practically unknown in Europe, yet it is most extraordinarily frequent in Kashmir, because the natives there wear next to the skin an oven containing burning charcoal. I show photographs of this charcoal oven, of Kashmiris wearing and using it, and also of the typical squamous-celled carcinoma with metastases resulting from the native practice. Carcinoma of the floor of the mouth is rare in European women although not uncommon in men; but in Ceylon and India generally the women suffer to a high degree from carcinoma of the inside of the mouth. This is due to the chewing of betel-nut and the practice of sleeping with the plug in the mouth; in the course of time carcinoma develops at the site so irritated. Without elaborating instances, it may be stated, in short, that the incidence of cancer on the surface of the body in different races of mankind is determined, on the whole, not so much by innate racial peculiarities, or differences in climate, soil, and diet, but rather by external irritants. The results of the study of the comparative incidence of cancer in man are of fundamental importance. They enhance the significance of two conclusions from histological and pathological investigation in Europeans: first, that cancer can arise locally in a circumscribed area; and second, that any part of the normal covering of the body may acquire cancerous properties. Hence it is also probable that more than one focus of origin, or even foci of different age, may be contained in a circumscribed area. Therefore, although the inception of malignant new growths is confined to a circumscribed area, and continued growth proceeds only from the resources of the tumour cells comprised in it, successive augmentations in the extent of the primary area by apposition cannot be excluded in all cases.

FIG. 4.



Percentage distribution of deaths from malignant disease in England and Wales, 1901-1907, classified according to age and sex.

FIG. 5.



Percentage distribution of cases of cancer in hospitals classified according to age and sex for comparison with Fig. 4.

I must point out emphatically that I do not feel justified at present in assigning anything more than an indirect or mediate etiological significance to chronic irritation and to other exogenous factors. The significance of chronic irritation is qualified by the fact of its not occasioning cancer in all individuals who subject, with equal intensity, identical parts of the body to its influence. An active prolonged or an intermittent process of regeneration and repair is intercalated before the development of cancer in tissues subject to chronic irritation. Observations, to which I shall refer later, have shown that there is an immense variety of carcinoma cells, all descended from normal cells, some of which pass into one another, while others do not, and are able to maintain their characteristics for prolonged periods during the artificial propagation of tumours. The same holds for sarcoma cells. It is not inconceivable that under the influences of chronic irritation the cells in a tissue undergoing a prolonged or intermittent process of regeneration and repair exhibit similar variations, some ultimately being capable of advancing to malignant cells and others not. The end result is possibly determined by a combination of these factors with constitutional conditions. In this way it becomes intelligible why the irritants themselves have so little in common. Haaland's observations in the laboratory of the Imperial Cancer Research Fund appear to have thrown much light on this subject. His studies on our tumour "37" concerning the experimental development of sarcoma—a phenomenon first recorded by Ehrlich and Apolant—have yielded evidence that repeated transplantation in some cases aids the process. At the time when carcinoma-sarcomatodes was obtained by this means no progress had taken place in the mouse yielding the mother material. From a review of the whole circumstances Haaland's observations point to the sarcomatous change arising in the tranformation of a few, perhaps isolated, normal connective tissue cells. Whether the process consists in a succession of small variations whereby they become transplantable and ultimately progress into sarcoma cells, or is a sudden acquisition of sarcomatous properties, is not definitely settled. It would appear that the repeated transplantation was of moment, in some cases, in effecting the transformation, partly by maintaining the cells in a continued or intermittent state of regeneration, partly by affording a means of selecting and perpetuating variations more capable of growth. This conclusion is put forward tentatively, for our studies on tumour "37" are still continuing, and a comparison will have to be made with another of our tumours "100" which Russell has found leads to the development of sarcoma. The behaviour of these two tumours as regards the development of sarcoma does not at present appear to be identical in all details, differing most prominently in that, whereas repeated transplantation aids the process for tumour "37," it hinders its advance in the case of tumour "100." Sarcoma development can be obtained constantly for tumour "100" provided growth is maintained for some 50 days in a single animal. Pure carcinomatous strains of both tumour "37" and tumour "100" have been maintained in propagation, so that it will be possible to harmonise their behaviour or to discover the nature of the differences if any really exist. I illustrate the experimental development of sarcoma in the course of the propagation of carcinoma by a series of slides for tumours "37" and "100."

---

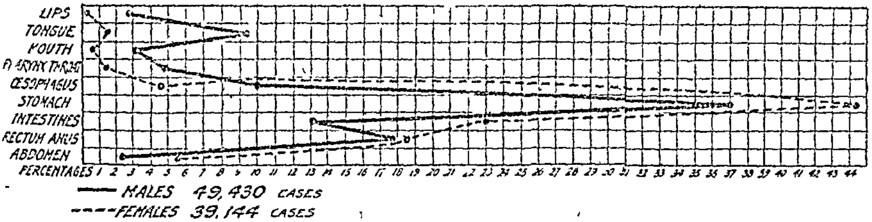
[3] For example, *physical injury*, as in fracture of bone, or in "brand" cancer, or the "horn core" of cattle, where squamous-celled carcinoma develops at the root of the right horn, to which a wagon is attached in India; *chemical*, as in paraffin, petroleum, arsenic, aniline, &c.; *radiant or actinic*, as in short clay-pipe, the Kangri, X ray, or where the skin over the shin bones of locomotive drivers has been exposed for years to the direct action of heat; *infective*, as in bilharzia of the bladder; tubercle in old lupus scars; Treponema pallidum in keratosis linguæ; tapeworms as recorded by Borrel; chronic inflammation and ulceration of all kinds, &c.

HEREDITARY, CONGENITAL, AND INFECTIVE HYPOTHESES OF CANCER

The question of the hereditary transmission of cancer has not been settled either one way or the other for man. The short duration of life in the mouse and the rapidity with which generation follows generation make it an ideal animal for the study of problems of heredity. For years we have devoted attention to breeding experiments with mice of cancerous stock. The starting points have been mice suffering naturally from the disease and relieved of their tumours by operation. In the first *400* mice, so bred, which lived over six months 30 cases of cancer appeared; the incidence of the disease continuing, however, to obey the law of age-incidence, without as yet giving any indication of in-born predisposition playing a part either in determining a local or constitutional liability to the disease, or even so much as an enhanced suitability for inoculation. Therefore it would appear that the disease or the local and general predispositions which apparently exist are always acquired, and, if so, may ultimately be found to be avoidable.

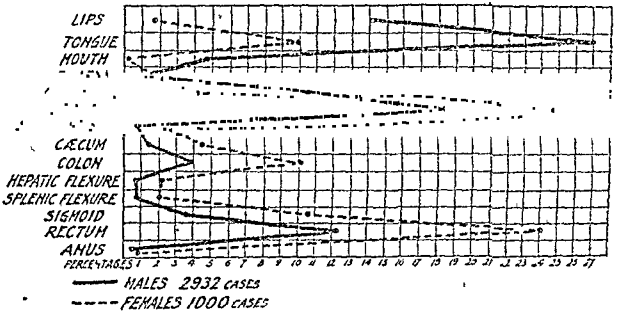
The pessimistic views entertained in regard to cancer are [illegible] nation of the ill defined idea [illegible] as a whole, being of "con- [illegible] compass the doom of many. This idea arises, in the first place, from a generalisation of the fact that certain forms [illegible] are undoubtedly associated with congenital a[illegible] neglect of the

FIG. 6.



Deaths from malignant disease of alimentary canal (England and Wales 1901-07) classified according to sex and part affected.

FIG. 7.



Incidence of carcinoma of alimentary canal (hospital cases) classified according to sex and part affected.

equally important fact that the acquisition of malignant properties by their component tissues is just as much a problem as the development of cancer in adult tissue. In the second place, it is due to seeking an analogy for the powers of growth of cancer in embryonic tissue. In the third place, it is founded on the assumption that the absence of histological differentiation in many cancers proved a biological resemblance to embryonic tissues previous to their differentiation—proved indeed a reversion to embryonic conditions.

The absence of any evidence of hereditary influences detracts much from hypotheses asserting a congenital origin for cancer. Other facts are even more emphatically opposed to them. The study of the incidence of cancer as determined by irritants in man demonstrates that the generalisation of the idea of a congenital or embryonic origin is incorrect. The growth of cancer is essentially different from the growth of embryonic tissue, analogies with which were natural so long as the growth of cancer was put an end to by the death of individuals. Experiment has revealed that the growth of cancer is, however, a unique biological phenomenon, disobeying all the laws of growth of embryonic tissue in accordance with which organisms and organs attain to their specific dimensions. The growth of cancer also differs in that in many instances it is accompanied by cyclical alternations between phases of more pronounced histological differentiation and phases in which all histological differentiation is absent. Any progressive histological change in the growth of cancer is in the direction of a disappearance of these alternations of histological structure, so that the histological differentiations exhibited at an earlier date are not manifested later.

When a carcinoma is transplanted the blood-vessels and supporting connective tissue scaffolding are supplied afresh as a reaction elicited by the chemiotactic influences of the parenchyma cells. The stroma of all transplanted tumours should be uniform if their characteristic elements possessed primary undifferentiated embryonic properties. On the contrary, tumours without any apparent histological differentiation elicit distinctive new vascular and connective tissue scaffoldings. The peculiarities of the stroma of different tumours remain constant during propagation. The fact indicates that the cells of malignant new growths, even when showing little or no indication of histological differentiation in the direction of any fully formed tissue, still possess permanent characters of a less obvious kind, and these characters are of the nature of specialisations or differentiations analogous to those which we recognise as histological differentiations. For over 60 propagable carcinomata growing in our laboratory it can be said that no single one is an exact duplicate of another. The cancer cells are therefore specialised and not undifferentiated cells. In the phenomena of induced resistance to the inoculation of cancer, especially in the specificities of immunity following the absorption of normal or cancer tissues, there is much that is opposed to the assumption that tumour cells are embryonic. Alternations in the rate of growth occur unlike anything known in the growth of embryos. In short, the interpretation of the absence of morphological differentiation as indicating a biological similarity of tumour cells to embryonic cells was due to the limitations of histological methods which were insufficient to reveal the fundamentally different biological properties of cancer cells indistinguishable by their aid.

If pathological anatomists have in the past often pointed out the difficulties in the way of drawing analogies between cancer and infective diseases, the comparative and experimental work of the past seven years has demonstrated that cancer has no analogy with *any known form* of infective disease. The force of this demonstration has appealed even to the staunchest supporters of a parasitic etiology for cancer, and has obliged them so to modify their opinions that I do not propose to discuss in detail the *petitio principii* into which they have been coerced, except with regard to the alleged occurrence of epidemics of cancer in rats, mice, and trout. Many tens of thousands of mice suffering from cancer have been under the most stringent observation in our laboratory. If cancer were communicable, animals housed along with those naturally suffering from, or inoculated with, cancer would be the first to suffer. In an experience extending over more than six years—i.e., more than three times the average length of a mouse's life—exhaustive investigation, during which some 200,000 mice have been inoculated, has shown that this risk does not exist. Those handling the animals incur still less risk in passing many hours daily dealing with cancerous animals in a room in which 10,000 of such mice and rats are usually housed at one time. If such a "cancer house" as never before existed has no dangers to human beings who spend their days in it, *a fortiori* other persons have no ground for apprehension that the ubiquity of cancer implies its transmission either directly or indirectly from animals to man, or *vice versâ*. In corresponding observations on mice suffering from spontaneous cancer no case of transference from mouse to mouse has occurred. Cancer is ubiquitous, yet there are the most striking limitations to its conveyance from one individual to another, continued growth taking place after inoculation into animals of the same species only. Inoculation is only successful by the implantation of living cells, but experiments show that this risk is negligible if it exists at all in nature.

Epidemics of cancer have been alleged to occur in the establishments of breeders of rats and mice, notwithstanding that investigations made under the much more satisfactory conditions obtaining for man have not given any statistical evidence of the epidemic or endemic occurrence of the disease. Our experience of such alleged epidemics may be illustrated by the proportions of cases of cancer to total numbers of mice supplied to us by four breeding establishments from Jan. 1st, 1906, to Oct. 21st, 1907:—

Breeding establishments	A.	B.	C.	D.
Tumour mice	10	6	35	18
Total mice	1302	1547	9698	11,842

The number of tumours occurring in these stocks of mice has been determined solely by the number of mice of "cancer-age" under observation. This is brought out particularly clearly in the difference between the age-constitution of the stock of Mr. C. and Mr. D., since the stock of the latter contains constantly a much higher proportion of young animals, and he supplied us with most of our young mice. Further, if we note the dates on which tumours are sent to us and arrange them in columns we find that the crops of tumours coincide with the ageing of groups of mice. Thus those aggregations of cases, loosely called "epidemics," by too enthusiastic advocates of a parasitic origin for cancer, are really evidence of the importance of knowing the age-constitution of the mouse population in which the cases occurred, as pointed out earlier when speaking of the age-incidence of cancer.

METABOLISM AND VITA PROPRIA OF TUMOUR CELLS.

We have often pointed out, from 1903 onwards, that the artificial propagation of cancer gave ideal facilities for studying the problems of its apparently continuous growth, particularly because the same parenchyma could be studied over any requisite length of time and under different experimental conditions. These advantages apply with even greater force to the study of metabolism, and the relations of tumours to their hosts when living under varying experimental conditions. The relation of propagated tumours to the animals bearing them has been shown by Cramer to be analogous to that obtaining between the fœtus *in utero* and the mother, only still greater quantities of tissue are built up. There is no evidence of toxic products injurious to the hosts; on the contrary, there is a compensatorily enhanced activity on their part, as revealed by Cramer's, Copeman's, and Hake's study of the gastric secretion, and by Cramer's investigations on gaseous metabolism. In the end, however, compensation breaks down, and, finally, the tumours live at the expense of the host. When this stage is reached the animals speedily die. It appears that a definite ratio obtains between the weight of tumour and the weight of the animal supporting it without disturbance of health. If the weight of tumour exceeds this relationship, the animal quickly suffers and succumbs. Compensation may be upset much more rapidly by taking advantage of the fact, that the rate of increase of some tumours is proportional to the dose of tumour material inoculated. In this way it can be shown that the terminal result is due to the greater number of the cells demanding food, and not to a greater avidity for it, and that death is not due to poisons.

When very young animals are made to bear rapidly growing tumours they remain dwarfs, the whole increase in weight the animal should show by a given age being made up of tumour. Medigreceanu's analysis of the relations of the different organs to tumour growth shows that when the animal remains a dwarf, individual organs—e.g., the heart, [illegible] tumour. Murray has shown that, when rapidly growing propagable tumours are inoculated into mice with spontaneous tumours which, as is well known, are rarely able to establish themselves in normal mice, the spontaneous tumour of the mouse itself outstrips the propagable tumour. Mice which have cured themselves of rapidly growing tumours, transplantable with ease, have, on the one hand, developed spontaneous tumours of their own, and the latter, on the other hand, could be transplanted into normal mice only with difficulty or not at all. Therefore transplantability is not determined solely by the rate of growth or the degree of avidity for food.

I may merely allude to other detailed investigations which are being conducted by Cramer into the general metabolism and its relation to the chemistry of the cancer cell, and to the fact that the cells of certain of our rapidly growing mouse tumours have been found by Abderhalden, in conjunction with Medigreceanu, to split up some synthetised polypeptides more rapidly than normal tissues do. As yet we have not got much beyond defining that the cancer cell has many of the *properties* of rapidly growing tissue without containing anything extraneous, and without secreting anything directly deleterious to the organism. In these ways, and in a variety of others, our knowledge of the nature of cancer growth and cancer metabolism is being advanced with so great exactness that [illegible] nce of cell equilibrium, [illegible] continuous growth of [illegible] precise conceptions of the process, as the following additional facts on tumour growth already promise. In 1905 we described cyclical alternations in the energy of growth of Jensen's tumour. Since then we have been able to confirm these observations on practically every one of the 60 propagable mouse tumours now growing in the laboratory. The later investigation of the phenomena of the alternation of positive and negative phases of growth has shown that cyclical changes in the cancer cell are revealed in a variety of ways as follows: (1) rise and fall in the percentage of successful inoculations; (2) rapid and slow growth of the tumours in different series, and in the individual tumours of a single series; (3) *transitory cessation of growth*; (4) alternating susceptibility of the tumour cells to dosage, and particularly to the greater or less degree of simultaneous immunisation depending upon the latter; and (5) Murray has drawn attention to cyclical alternations in the histological structure from alveolar to acinous, and *vice versâ*. I exhibit a series of slides illustrating these points in the *vita propria* of tumour cells. It is clear that by these alternating properties of the tumour cells an explanation is afforded of the varied histological picture which different parts of the same tumour often exhibit, as well as of the erratic clinical course of cancer in man. In the human subject there are corresponding fluctuations in the growth of cancer. In one part of a tumour growth is proceeding rapidly, in another part slowly. Periods of exacerbation alternate with periods of amelioration. Further, secondary nodules of growth are known to disappear while others are growing, and occasionally primary growths have disappeared. The observations made on mice emphasise the importance of those clinical features, largely discredited in the human subject, since it was impossible to resolve them into the orderly sequence which the prolonged observation of the growth and structure of propagable tumours has permitted. These studies on the *vita propria* of the cancer cell make it apparent that its secrets are being penetrated gradually. I have already pointed out that of our 60 mammary tumours capable of continuous propagation under uniform experimental conditions not one is a duplicate of another; nevertheless, they all appear to have one feature in common, for the biological properties of their cells alternate in the ways I have enumerated, and therefore something fundamental is revealed by the cyclical fluctuations in their general biological behaviour, structure, and rate of growth. The cyclical alternations in the percentage of successful inoculations and in the negative and positive phases of the rates of growth of the resulting tumours are most impressive. I venture to suggest as an incentive to further investigation the solution of the problem, Are tumour cells, in recovering the enhanced powers of proliferation they exhibit in the positive phase of growth, but imitating the process by which normal cells passed into cancer cells?

Tumour Cells as Indicators of the Nature of the "Soil" Offered Them.

In order to [illegible] veen tumours and [illegible] the behaviour of [illegible] nder varying experimental conditions. The experimental conditions I propose to consider are those that living animals offer. The living cancer cell indicates the condition of the "soil" into which it is implanted—in other words, the cancer cell is the reagent or "indicator," and the living mouse is the test tube containing something to be tested. In all experiments of this kind it is well to bear in mind the distinctions which may, and usually do, obtain between reactions *in vitro* and *in vivo*. The glass test-tube is, or ought to be, indifferent; breaking off a piece and casting it into the contents should not alter the conditions. In the *in vivo* experiments, which are alone possible in the case of cancer, the mouse is the living test-tube and it is not indifferent; removing a piece and, so to say, incorporating it with the contents is not only not an indifferent procedure but, as Woglom has shown, is one of the most efficacious ways of demonstrating certain of the reactions revealed by using the living cancer cell as an "indicator."

I have alluded to the varying qualities of tumour cells even under uniform conditions, and it may seem strange to emphasise their experimental importance when appraising the significance of the results of attempts to modify experimentally the behaviour of a tumour by changing the [illegible] Neverthe- [illegible] the methods [illegible] universally ignored in the race for priority of publishing evidence of immunity against cancer. Much of what has been written on immunity, or resistance of mice to the inoculation of cancer, would not have been published had the authors studied sufficiently the varying qualities of tumour cells and the influences of other uncontrollable and controllable factors as an investigation necessarily preliminary to claiming that they had immunised mice against inoculation, had vaccinated them against its attack, or had actually cured them of it. We spent three years studying the fluctuating growth and other varying qualities of the tumour cells, the influences of dose of tumour, age, and weight of mice, time intervals, and the effect of injuring or actually grinding down tumour and normal tissue in order that our attempts to modify tumour growth should be conducted with the precautions necessary to avoid experimental fallacies. In this way we cleared up the contradictions we had recorded between observations made *in vitro* and *in vivo* with immune sera, as well as accounted for the apparent curative results obtained by injecting immune sera into animals with tumours, before we devoted any communication exclusively to the subject of immunity. When we published definite statements in 1906 Clowes had already claimed (1905) to have demonstrated antibodies directed against the cancer cell, and Ehrlich had set up (1906) the doctrines of atreptic immunity and pan-immunity. Our observations are opposed both to Clowes's and to Ehrlich's interpretations of their experiments. We were able to show at once that immunity to the inoculation of mouse cancer could be produced both by the absorption of cancer tissue and of normal tissue of the mouse, but not by cancer tissue or normal tissue of strange species. We also showed that the resistance which tumour mice showed to a secondary inoculation was actively [illegible] for different tumours. [illegible] sults were arrived [illegible] by employing the [illegible] and came independently to the conclusion that the resistance was specific for different tumours, and Borrel and Bridré have arrived at the same conclusion.

Apparent contradictions still exist between some of our conclusions and those of other workers, but I believe they are mainly, if not wholly, explicable by neglect of some of the precautions we have so often emphasised. Two of these precautions may be alluded to in more detail. The differences obtaining between young and old mice in their suitability for inoculation and growth are very important. You can easily appreciate how, if a tumour is sent from one country to another, and there transplanted into old mice a negative result may be obtained which it would be wrong to assign to differences in race of mice. I show you a chart of such an experiment where some of the difference in the growth of an English tumour in German mice is certainly due to the higher age of the latter. The effect is not so great as to lead to an entirely negative result because the tumour cells were in the positive phase of growth, but on the next slide they are shown in the negative phase of growth and not a single tumour developed in the strange soil. Differences in the mice of different countries exist, however, as the following slide shows, where there is entire absence of growth of an English tumour in young Italian mice. Whether these differences in the mice of different countries are racial differences or are less permanent and due to diet and environment is not yet definitely settled. They do not exist for all tumours, as the slide I show of the growth of Borrel's tumour "B" demonstrates. This French tumour grew at once in 100 per cent. when inoculated into English mice and, as the slide shows, yielded large rapidly growing tumours. It is a general property of all tumours that they grow not so well or not at all in old mice, as the charts I show you demonstrate. You can easily appreciate that if the middle-aged and old mice which were negative to a first inoculation had been reinoculated they would have proved resistant again to any tumour. The resistance would appear to be general, for its specific nature would be concealed. The same appearance of general immunity can be obtained after inoculating the tumours or tissues of strange species of animals into sufficently aged mice.

We have often pointed out the importance of the dose of tumour material inoculated. Together with the consideration of age it merits equally emphatic mention if the results of other investigators are to be harmonised with our own; this applies both to doses used to induce immunity and to doses used to test for its existence. Any dose of tumour will not suffice to produce a new tumour at the site of inoculation. The dose may be too large, so that only transitory growths develop; or it may be too small, so that no growth is evident, as the following charts show. When a tumour develops the dose from which it started is not a matter of indifference if a later inoculation is to be made into the same series of animals. A chart I show demonstrates a diminution in the success of inoculation with diminishing doses, and a corresponding diminution in the degree of resistance of the mice to a second inoculation. The phenomena can be explained only by the primary inoculation having induced an active immunity concomitant with the establishment and the growth of the tumours. This concomitant auto-immunisation may be very perfect, as I show in the next chart taken from Haaland's experiments with our tumour "206." In the case of this tumour it is so complete that every mouse cures itself of its growth. The resistance induced against a reinoculation of the same tumour is more complete than against other tumours. The resistance in this sense is specific and the conditions of growth are also specific since a tumour of different nature, although of the same organ, will grow in mice which are completely protected against a reinoculation of the tumour first inoculated. The lesser degree of protection which one kind of mouse tumour induces against other kinds is due probably not to cancer tissue as such but to its properties *quâ* mouse tissue.

A sarcoma of a cat or rat vaccinated into a mouse lacks the power of protecting it against subsequent inoculation of mouse sarcoma. I show a chart illustrating the absence of immunity when rats have been previously inoculated with cat and with mouse sarcoma. The same holds for corresponding experiments with carcinoma. In short, animals can be rendered unsuitable for the inoculation and growth of cancer only by treating them with malignant new growths or with normal tissues of their own species. In the latter case the degree of resistance corresponds closely to the relationship between the normal tissue vaccinated and the tumour subsequently inoculated. I have a chart showing that skin protects best against skin cancer, and the figures of the site of inoculation in a control and in an immune mouse demonstrate the efficiency of the protection. These facts refer us back again to the transplantation of cancer being limited to animals of their own species, and together with them demonstrate the retention by malignant new growths of the tissue characters of a species. The malignant new growths of different species of animals resemble one another just as much, and differ just as much, as their respective organs and tissues do—e.g., as the liver and lungs of man resemble and differ from those organs of the mouse. The power of normal tissues to induce protection is not restricted to those obtained from other individuals. Woglom has shown that the absorption of a mouse's own tissues—e.g., of the spleen—effectively induces protection against subsequent inoculation.

The parallel between cancerous and normal tissue extends much further. Immunity or resistance is only induced by the inoculation of living tumour cells or of living normal cells. Haaland has made very elaborate investigations on this subject. He has found that cancer tissues and normal tissues are deprived entirely of their powers of inducing resistance if they are frozen and effectively crushed. I illustrate this parallel by a chart showing the protective power of living normal skin and its loss of power to induce protection after being disintegrated in this way. Immunity, therefore, does not appear to be induced by the chemical contents of the cells.

The next chart is of particular interest. It illustrates the action of radium upon normal and cancerous tissues without causing their disintegration. After exposure to radium for an interval within which no structural alteration can be observed in the tissues, either with the naked eye or microscopically, they may be completely deprived of their powers of growing and of immunising. The abolition of these vital properties is here achieved with retention of the histological structure of the tissues and of intactness of the cells, and the experiments demonstrate that the power to elicit these biological reactions is intimately bound up with, and dependent upon, the vital activities of the cells themselves.

Not only does no immunity follow the inoculation of effectively disintegrated material, but, on the contrary, the mice may thereby be made more suited for the growth of tumours. This hypersensitiveness is, however, not so specifically induced as resistance. It can be induced both by tumour and by normal tissue of strange species, and since resistance may follow the absorption of a mouse's own living tissues it is also probable that hypersensitiveness may be induced by its own tissues when properly disintegrated.

The nature of the immunity to cancer is not yet fully elucidated. It has no analogy with anything known for the infective diseases. The hopes of obtaining an anti-cancer serum cautiously expressed by Jensen in 1903 have not yet been fulfilled. Further investigation of the action of the serum of immune animals both *in vitro* and *in vivo* has justified the cautious references we also made to the same subject in 1904 and 1905. Clowes's evidence of the presence of a specific antibody in the serum able to exercise a curative effect *in vivo* and a lethal effect on the tumour cells *in vitro* stands alone. We have never ascribed to the action of antibodies the beneficial effects which Jensen, Clowes, and we ourselves sometimes noted after the injection of the serum of immune animals. The action of immune serum *in vitro* has been found both by Flexner and ourselves to be just as injurious, but not more so, to the cancer cell as is normal serum. It can be now stated with some confidence that animals which are absolutely protected against inoculation do not yield a serum which when introduced into new animals has a power of protecting them against inoculation, still less is there any evidence of immune sera having a power to cure animals of tumours already growing. Highly immune mothers apparently do not transfer immunity to their offspring as do animals immune to diphtheria or other poison of infective disease.

At present artificial resistance can be made efficacious mainly against the inoculation of grafts which speedily die in immunised animals. I show you a picture of the manner in which a normal mouse responds with a new connective-tissue scaffolding, and the contrast that obtains in an immune animal which does not respond in this way. The most evident cause of the death of the grafts is that they cannot grow into an organised tissue and nourish themselves. We have explained the absence of the specific stroma reaction necessary for a graft to *develop into a tumour by assuming* that the chemiotactic properties of the cancer cells are paralysed, so that *they are no longer able to elicit the* specific response on the part of the host. Russell has been able to demonstrate that this is the nature of the process. Working in our laboratory Da Fano has carried Russell's investigations further, and besides confirming that the specific connective-tissue and vascular scaffolding supplied by a normal is not supplied by an immune animal, Da Fano has shown that the entire connective-tissue system of the animal responds during the processes both of spontaneous *healing* and of immunisation. Any subsequent inoculation fails to elicit the response necessary *for* continued growth. *It* is not intended to deny that changes in the blood plasma accompany the acquire*ment* of resistance or immunity, *but* while it is difficult to conceive of so complete a constitutional change *occurring without this intervention, the constitutional* changes throughout the connective tissues prove that changes *in the blood plasma are not solely* responsible, and that the immunity is not purely of a humoral nature but to a large extent cellular. An explanation is thus afforded of the negative results which have hitherto attended all Borrel's, Ehrlich's, Flexner's, Jensen's, and our own attempts to obtain an anti-cancerous serum. I would merely point out that the connective-tissue changes observed in mice during the absorption of tumour tissue are parallel to what has been described for spontaneous healing in man—for example, by Orth.

CONCLUSION.

From a survey of cancer in man and animals the following conclusions stand out. The first confirms that at which Waldeyer arrived in 1867 from his studies on man; the cells of vertebrates—e g., of the skin—possess or acquire some property or properties in common, in virtue of which they may be transformed into cancer cells under what appear to be very different circumstances. The second is the application of the law of age-incidence to vertebrates generally, irrespective of the absolute duration of life. Third, the [illegible] a circumscribed area. Fourth, when all [illegible] in cells within a circum- [illegible] se cells and the organism [illegible] e conclusions the experimental reproduction of all the lesions of cancer has enabled us to add the many others I have related to you.

At this early date it is sufficient to have thrown a little light on four aspects of the etiology of cancer. First, on the constitutional conditions favourable and unfavourable for the growth of cancer cells. Second, on how cancer cells after having passed into a phase of low proliferative energy may re-acquire high powers of proliferation and of resistance to changes in their environment. Third, on the possible nature of the indirect association irritants have to the disease. Fourth, that cancer cells even when of the same organ have been resolved into a larger number of varieties able to maintain their individuality than was previously conceivable. These varieties are of the nature of specialisations or differentiations unrecognisable by histological methods. Experiment has put many older explanations out of court. *No evidence* has been obtained in favour of a hereditary, congenital, or embryonic explanation of etiology, nor has any analogy been discovered with known forms of infective disease. I have illustrated how experiment is resolving the contradictions in the clinical behaviour and in the results of *surgical treatment* of cancer into orderly sequence *If experiment has not solved* many of the old problems, it has replaced them by new ones, which is a *fair* proof that progress is being made.

In the survey I have *given* of the *progress* of the experimental study of *cancer I have* had occasion to draw attention *to the bearing of many of the results* on purely biological *matters, and it is well to conclude* by emphasising the comparative *biological importance* of cancer investigation. [illegible] it possible that portions [illegible] be kept growing for a [illegible] of the whole animal. But [illegible] ds of tissues now being propagated separately make it theoretically possible that the majority of the tissues, *once* they have acquired cancerous properties, may be so grown and *segregated*. *In other* words, a living animal can be analysed into many of its *living component* tissues. The finer relations of various *kinds of tissues to* one another *have* been revealed by the application of the new methods. The biological altera*tions which living* mammalian cells may undergo suddenly, *as* well as gradually, under the influence of experimental *conditions can now* be *studied*. These and many other achievements *in the field of general* biology are the most *important practical fruits which* have accrued from the experimental *study of* cancer, upon which they have only indirect bearings. *Ultimately they* are bound to be of far-reaching general *biological* importance, although to-day they are merely the weapons that have been *forged to* attack cancer. Their *further development* and *their* utilisation for the solution of purely biological problems will probably precede the solution of many of the problems surrounding the nature and causes of cancer.

Having put before you a claim for the value of comparative and experimental investigation with the confidence that it is based on a sure foundation, and evidence that it is advancing our knowledge of the etiology and pathogeny of cancer, I crave your indulgence till time shall enable these methods finally to clear up the cellular problems which they have helped us *to define* so much more *precisely* than ever before.

ABSTRACT OF THE

Presidential Address

Delivered before the British Association for the Advancement of Science at Winnipeg on August 25th, 1909,

BY PROFESSOR SIR J. J. THOMSON, M.A., LL.D., D.Sc., F.R.S.

[IN his opening remarks Professor Thomson referred to the *fact that the* British Association at one time *held all* its meetings in the British Isles, a practice which, however, was first departed *from at its meeting in Montreal* in 1884, and so in that year the Association was changed from an insular into an imperial one. Proceeding, he claimed to have some experience of, at any rate, one branch of Canadian science, for it had been his privilege to receive at the Cavendish Laboratory at Cambridge many students from the Canadian universities. Referring to the educational systems in force in various countries he thought that Canada had been wise not to imitate the system prevailing in the older English universities. The chief evil, he said, from which they at Cambridge suffered and which was avoided in Canada was the excessive competition for scholarships. The result of this, he added, was that preparation for scholarships *dominated the education of the great* majority of the cleverer boys who come to Oxford and Cambridge, *and in some quarters it seems to be held that* the chief duty of a schoolmaster and the best test of his efficiency was to make his boys get scholarships. The result often is that two years before examination the boy begins to specialise, and from the age of 16 he does little else than the subject; be it mathematics, classics, or natural science, for which he wishes to get a scholarship; then on entering the university he spends three or *four* years studying the same subject before he takes his degree which was the proper time for his real *life* work to begin. After pleading [illegible]

Thompson proceeded:—]

It has usually been the practice of the President of this Association to give some account of the progress made in the last few years in the branch of science which he has the honour to represent. I propose this evening to follow that precedent and to attempt to give a very short account of some of the more recent developments of physics, and the new conceptions of physical processes to which they have led. The period which has elapsed since the Association last met in Canada has been one of almost unparalleled activity in many branches of physics, and many new and unsuspected properties of matter and electricity have been discovered. The history of this period affords a remarkable illustration of the effect which may be produced by a single discovery; for it is, I think, to the discovery of the Roentgen rays that we owe the rapidity of the progress which has recently been made in physics. A striking discovery like that of the Roentgen rays acts much like the discovery of gold in a sparsely-populated country; it attracts workers who come in the first place for the gold, but who may find that the country has other products, other charms, perhaps even more valuable than the gold itself. The country in which the gold was discovered in the case of the Roentgen rays was the department of physics dealing with the discharge of electricity through gases, a subject which, almost from the beginning of electrical science, has attracted a few enthusiastic workers, who felt convinced that the key to unlock the secret of electricity was to be found in a vacuum tube. Roentgen, in 1895, showed that when electricity passed through such a tube, the tube emitted rays which could pass through bodies opaque to ordinary light; which could, for example, pass through the flesh of the body and throw a shadow of the bones on a suitable screen. The fascination of this discovery attracted many workers to the subject of the discharge of electricity through gases, and led to great improvements in the instruments used in this type of research. It is not, however, to the power of probing dark places, important though this is, that the influence of Roentgen rays on the progress of science has mainly been due; it is rather because these rays make gases, and, indeed, solids and liquids, through which they pass conductors of electricity. It is true that before the discovery of these rays other methods of making gases conductors were known, but none of these was so convenient for the purposes of accurate measurement. The study of gases exposed to Roentgen rays has revealed in such gases the presence of particles charged with electricity; some of these particles are charged with positive, others with negative, electricity. The properties of these particles have been investigated; we know the charge they carry, the speed with which they move under an electric force, the rate at which the oppositely charged ones recombine, and these investigations have thrown a new light, not only on electricity, but also on the structure of matter.

We know from these investigations that electricity, like matter, is molecular in structure, that just as a quantity of hydrogen is a collection of an immense number of small particles called molecules, so a charge of electricity is made up of a great number of small charges, each of a perfectly definite and known amount. Helmholtz said in 1880 that in his opinion the evidence in favour of the molecular constitution of electricity was even stronger than that in favour of the molecular constitution of matter. How much stronger is that evidence now, when we have measured the charge on the unit and found it to be the same from whatever source the electricity is obtained. Nay, further, the molecular theory of matter is indebted to the molecular theory of electricity for the most accurate determination of its fundamental quantity, the number of molecules in any given quantity of an elementary substance.

The great advantage of the electrical methods for the study of the properties of matter is due to the fact that whenever a particle is electrified it is very easily identified, whereas an uncharged molecule is most elusive; and it is only when these are present in immense numbers that we are able to detect them. A very simple calculation will illustrate the difference in our power of detecting electrified and unelectrified molecules. The smallest quantity of unelectrified matter ever detected is probably that of neon, one of the inert gases of the atmosphere. Professor Strutt has shown that the amount of neon in $\frac{1}{20}$ of a cubic centimetre of the air at ordinary pressures can be detected by the spectroscope; Sir William Ramsay estimates that the neon in the air only amounts to 1 part of neon in 100,000 parts of air, so that the neon in $\frac{1}{20}$ of a cubic centimetre of air would only occupy at atmospheric pressure a volume of half a millionth of a cubic centimetre. When stated in this form the quantity seems exceedingly small, but in this small volume there are about ten million million molecules. Now the population of the earth is estimated at about fifteen hundred millions, so that the smallest number of molecules of neon we can identify is about 7000 times the population of the earth. In other words, if we had no better test for the existence of a man than we have for that of an unelectrified molecule we should come to the conclusion that the earth is uninhabited. Contrast this with our power of detecting electrified molecules. We can by the electrical method, even better by the cloud method of C. T. R. Wilson, detect the presence of three or four charged particles in a cubic centimetre. Rutherford has shown that we can detect the presence of a single α particle. Now the particle is a charged atom of helium; if this atom had been uncharged we should have required more than a million million of them, instead of one, before we should have been able to detect them. We may, I think, conclude, since electrified particles can be studied with so much greater ease than unelectrified ones, that we shall obtain a knowledge of the ultimate structure of electricity before we arrive at a corresponding degree of certainty with regard to the structure of matter.

We have already made considerable progress in the task of discovering what the structure of electricity is. We have known for some time that of one kind of electricity—the negative—and a very interesting one it is. We know that negative electricity is made up of units all of which are of the same kind; that these units are exceedingly small compared with even the smallest atom, for the mass of the unit is only $\frac{1}{1700}$ part of the mass of an atom of hydrogen; that its radius is only 10^{-13} centimetre, and that these units, "corpuscles" as they have been called, can be obtained from all substances. The size of these corpuscles is on an altogether different scale from that of atoms; the volume of a corpuscle bears to that of the atom about the same relation as that of a speck of dust to the volume of this room. Under suitable conditions they move at enormous speeds which approach in some instances the velocity of light. The discovery of these corpuscles is an interesting example of the way Nature responds to the demands made upon her by mathematicians. Some years before the discovery of corpuscles it had been shown by a mathematical investigation that the mass of a body must be increased by a charge of electricity. This increase, however, is greater for small bodies than for large ones, and even bodies as small as atoms are hopelessly too large to show any appreciable effect; thus the result seemed entirely academic. After a time corpuscles were discovered, and these are so much smaller than the atom that the increase in mass due to the charge becomes not merely appreciable but so great that, as the experiments of Kaufmann and Bucherer have shown, the whole of the mass of the corpuscle arises from its charge.

We know a great deal about negative electricity; what do we know about positive electricity? Is positive electricity molecular in structure? Is it made up into units, each unit carrying a charge equal in magnitude though opposite in sign to that carried by a corpuscle? Does, or does not, this unit differ, in size and physical properties, very widely from the corpuscle? We know that by suitable processes we can get corpuscles out of any kind of matter, and that the corpuscles will be the same from whatever source they may be derived. Is a similar thing true for positive electricity? Can we get, for example, a positive unit from oxygen of the same kind as that we get from hydrogen? For my own part, I think the evidence is in favour of the view that we can, although the nature of the unit of positive electricity makes the proof much more difficult than for the negative unit. In the first place we find that the positive particles—"canalstrahlen" is their technical name—discovered by our distinguished guest, Dr. Goldstein, which are found when an electric discharge passes through a highly rarefied gas, are, when the pressure is very low, the same, whatever may have been the gas in the vessel to begin with. If we pump out the gas until the pressure is too low to allow the discharge to pass, and then introduce a small quantity of gas and restart the discharge, the positive particles are the same whatever kind of gas may have been introduced. I have, for example, put into the exhausted vessel oxygen, argon, helium, the vapour of carbon tetrachloride, none of which contain hydrogen, and found the positive particles to be the same as when hydrogen was introduced.

Some experiments made lately by Wellisch in the Cavendish Laboratory strongly support the view that there is a definite unit of positive electricity independent of the gas from which it is derived; these experiments were on the velocity with which positive particles move through mixed gases. If we have a mixture of methyl-iodide and hydrogen exposed to Roentgen rays, the effect of the rays on the methyl-iodide is so much greater than on the hydrogen that, even when the mixture contains only a small percentage of methyl-iodide, practically all the electricity comes from this gas, and not from the hydrogen. Now if the positive particles were merely the residue left when a corpuscle had been abstracted from the methyl-iodide, these particles would have the dimensions of a molecule of methyl-iodide; this is very large and heavy, and would therefore move more slowly through the hydrogen molecules than the positive particles derived from hydrogen itself, which would, on this view, be of the size and weight of the light hydrogen molecules. Wellisch found that the velocities of both the positive and negative particles through the mixture were the same as the

chloride, or mercury methyl, was used instead of methyl-iodide. These and similar results lead to the conclusion that the atom of the different chemical elements contains definite units of positive as well as of negative electricity, and that the positive electricity, like the negative, is molecular in structure.

The investigations made on the unit of positive electricity show that it is of quite a different kind from the unit of negative: the mass of the negative unit is exceedingly small compared with any atom, the only positive units that up to the present have been detected are quite comparable in mass with the mass of an atom of hydrogen; in fact, they seem equal to it. This makes it more difficult to be certain that the unit of positive electricity has been isolated, for we have to be on our guard against its being a much smaller body attached to the hydrogen atoms which happen to be present in the vessel. If the positive units have a much greater mass than the negative ones, they ought not to be so easily deflected by magnetic forces when moving at equal speeds; and in general the insensibility of the positive particles to the influence of a magnet is very marked; though there are cases where the positive particles are much more readily deflected, and these have been interpreted as proving the existence of positive units comparable in mass with the negative ones. I have found, however, that in these cases the positive particles are moving very slowly, and that the ease with which they are deflected is due to the smallness of the velocity and not to that of the mass. It should, however, be noted that M. Jean Becquerel has observed in the absorption spectra of some minerals, and Professor Wood in the rotation of the plane of polarisation by sodium vapour, effects which could be explained by the presence in the substances of positive units comparable in mass with corpuscles. This, however, is not the only explanation which can be given of these effects, and at present the smallest positive electrified particles of which we have direct experimental evidence have masses comparable with that of an atom of hydrogen.

A knowledge of the mass and size of the two units of electricity, the positive and the negative, would give us the material for constructing what may be called a molecular theory of electricity, and would be a starting-point for a theory of the structure of matter; for the most natural view to take, as a provisional hypothesis, is that matter is just a collection of positive and negative units of electricity, and that the forces which hold atoms and molecules together, the properties which differentiate one kind of matter from another, all have their origin in the electrical forces exerted by positive and negative units of electricity, grouped together in different ways in the atoms of the different elements. As it would seem that the units of positive and negative electricity are of very different sizes, we must regard matter as a mixture containing systems of very different types, one type corresponding to the small corpuscle the other to the large positive unit.

Since the energy associated with a given charge is greater the smaller the body on which the charge is concentrated, the energy stored up in the negative corpuscles will be far greater than that stored up by the positive. The amount of energy which is stored up in ordinary matter in the form of the electrostatic potential energy of its corpuscles is, I think, not generally realised. All substances give out corpuscles, so that we may assume that each atom of a substance contains at least one corpuscle. From the size and the charge on the corpuscle, both of which are known, we find that each corpuscle has 8×10^{-7} ergs of energy; this is on the supposition that the usual expressions for the energy of a charged body hold when, as in the case of a corpuscle, the charge is reduced to one unit. Now in one gramme of hydrogen there are about 6×10^{23} atoms, so if there is only one corpuscle in each atom the energy due to the corpuscles in a gramme of hydrogen would be 48×10^{16} ergs, or 11×10^{9} calories. This is more than seven times the heat developed by one gramme of radium, or than that developed by the burning of five tons of coal. Thus we see that even ordinary matter contains enormous stores of energy; this energy is fortunately kept fast bound by the corpuscles; if at any time an appreciable fraction were to get free the earth would explode and become a gaseous nebula.

The matter of which I have been speaking so far is the material which builds up the earth, the sun, and the stars, the matter studied by the chemist, and which he can represent by a formula; this matter occupies, however, but an insignificant fraction of the universe. It forms but minute islands in the great ocean of the ether, the substance with which the whole universe is filled. The ether is not a fantastic creation of the speculative philosopher; it is as essential to us as the air we breathe. For we must remember that we on this earth are not living on our own resources; we are dependent from minute to minute upon what we are getting from the sun, and the gifts of the sun are conveyed to us by the ether. It is to the sun that we owe not merely night and day, springtime and harvest, but it is the energy of the sun, stored up in coal, in waterfalls, in food, that practically does all the work of the world. How great is the supply the sun lavishes upon us becomes clear when we consider that the heat received by the earth under a high sun and a clear sky is equivalent, according to the measurements of Langley, to about 7000 horse-power per acre. Though our engineers have not yet discovered how to utilise this enormous supply of power, they will, I have not the slightest doubt, ultimately succeed in doing so; and when coal is exhausted and our water-power inadequate, it may be that this is the source from which we shall derive the energy necessary for the world's work. When that comes about our centres of industrial activity may perhaps be transferred to the burning deserts of the Sahara, and the value of land determined by its suitability for the reception of traps to catch sunbeams. This energy, in the interval between its departure from the sun and its arrival at the earth, must be in the space between them. Thus this space must contain something which, like ordinary matter, can store up energy, which can carry at an enormous pace the energy associated with light and heat, and which can, in addition, exert the enormous stresses necessary to keep the earth circling round the sun and the moon round the earth. The study of this all-pervading substance is perhaps the most fascinating and important duty of the physicist.

On the electro-magnetic theory of light, now universally accepted, the energy streaming to the earth travels through the ether in electric waves; thus practically the whole of the energy at our disposal has at one time or another been electrical energy. The ether must, then, be the seat of electrical and magnetic forces. We know, thanks to the genius of Clerk Maxwell, the founder and inspirer of modern electrical theory, the equations which express the relation between these forces, and although for some purposes these are all we require, yet they do not tell us very much about the nature of the ether. Is the ether dense or rare? Has it a structure? Is it at rest or in motion? are some of the questions which force themselves upon us.

Let us consider some of the facts known about the ether. When light falls on a body and is absorbed by it, the body is pushed forward in the direction in which the light is travelling, and if the body is free to move it is set in motion by the light. Now it is a fundamental principle of dynamics that when a body is set moving in a certain direction, or, to use the language of dynamics, acquires momentum in that direction, some other mass must lose the same amount of momentum; in other words, the amount of momentum in the universe is constant. Thus when the body is pushed forward by the light some other system must have lost the momentum the body acquires, and the only other system available is the wave of light falling on the body; hence we conclude that there must have been momentum in the wave in the direction in which it is travelling. Momentum, however, implies mass in motion. We conclude, then, that in the ether through which the wave is moving there is mass moving with the velocity of light. The experiments made on the pressure due to light enable us to calculate this mass, and we find that in a cubic kilometre of ether carrying light as intense as sunlight is at the surface of the earth, the mass moving is only about one-fifty-millionth of a milligramme. We must be careful not to confuse this with the mass of a cubic kilometre of ether; it is only the mass moved when the light passes through it; the vast majority of the ether is left undisturbed by the light. Now, on the electro-magnetic theory of light, a wave of light may be regarded as made up of groups of lines of electric force moving with the velocity of light; and if we take this point of view we can prove that the mass of ether per cubic centimetre carried along is proportional to the energy possessed by these lines of electric force per cubic centimetre, divided by the square of the velocity of light. But though lines of electric force carry some of the ether along with them as they move, the amount so carried, even in the strongest electric fields we can produce, is but a minute fraction of the ether in their neighbourhood. This is proved by an experiment made by Sir Oliver Lodge in which light was made to travel through an electric field in rapid motion. If the electric field had carried the whole of the ether with it, the velocity of the light would have been increased by the velocity of the electric field. As a matter of fact, no increase whatever could be detected, though it would have been registered if it had amounted to one-thousandth part of that of the field.

The ether carried along by a wave of light must be an exceedingly small part of the volume through which the wave is spread. Parts of this volume are in motion, but by far the greater part is at rest; thus, in the wave front there cannot be uniformity, at some parts the ether is moving, at others it is at rest—in other words, the wave front must be more analogous to bright specks on a dark ground than to a uniformly illuminated surface. The place where the density of the ether carried along by an electric field rises to its highest value is close to a corpuscle, for round the corpuscles are by far the strongest electric fields of which we have any knowledge. We know the mass of the corpuscle; we know from Kaufmann's experiments that this arises entirely from the electric charge, and is therefore due to the ether carried along with the corpuscle by the lines of force attached to it. A simple calculation shows that one-half of this mass is contained in a volume seven times that of a corpuscle. Since we know the volume of the corpuscle as well as the mass, we can calculate the density of the ether attached to the corpuscle; doing so, we find it amounts to the prodigious value of about 5×10^{10}, or about 2000 million times that of lead. Sir Oliver Lodge, by somewhat different considerations, has arrived at a value of the same order of magnitude. Thus around the corpuscle ether must have an extravagant density: whether the density is as great as this in other places depends upon whether the ether is compressible or not. If it is compressible, then it may be condensed round the corpuscles, and there have an abnormally great density; if it is not compressible, then the density in free space cannot be less than the number I have just mentioned.

With respect to this point we must remember that the forces acting on the ether close to the corpuscle are prodigious. If the ether were, for example, an ideal gas whose density increased in proportion to the pressure, however great the pressure might be, then if, when exposed to the pressures which exist in some directions close to the corpuscle, it had the density stated above, its density under atmospheric pressure would only be about 8×10^{-16}, or a cubic kilometre would have a mass less than a gramme; so that instead of being almost incomparably denser than lead it would be almost incomparably rarer than the lightest gas. I do not know at present of any effect which would enable us to determine whether ether is compressible or not. And although at first sight the idea that we are immersed in a medium almost infinitely denser than lead might seem inconceivable, it is not so if we remember that in all probability matter is composed mainly of holes. We may, in fact, regard matter as possessing a bird-cage kind of structure in which the volume of the ether disturbed by the wires when the structure is moved is infinitesimal in comparison with the volume enclosed by them. If we do this, no difficulty arises from the great density of the ether; all we have to do is to increase the distance between the wires in proportion as we increase the density of the ether.

[After discussing the nature of potential energy, Professor Thomson proceeded:—]

We may thus regard the ether as a bank in which we may deposit energy and withdraw it at our convenience. The mass of the ether attached to the system will change as the potential energy changes, and thus the mass of a system whose potential energy is changing cannot be constant; the fluctuations in mass under ordinary conditions are, however, so small that they cannot be detected by any means at present at our disposal. Inasmuch as the various forms of potential energy are continually being changed into heat energy, which is the kinetic energy of the molecules of matter, there is a constant tendency for the mass of a system such as the earth or the sun to diminish, and thus as time goes on for the mass of ether gripped by the material universe to become smaller and smaller; the rate at which it would diminish would, however, get slower as time went on, and there is no reason to think that it would ever get below a very large value.

As our knowledge of the properties of light has progressed we have been driven to recognise that the ether when transmitting light possesses properties which, before the introduction of the electro-magnetic theory, would have been thought to be peculiar to an emission theory of light and to be fatal to the theory that light consists of undulations. Take, for example, the pressure exerted by light. This would follow as a matter of course if we supposed light to be small particles moving with great velocities, for these, if they struck against a body would manifestly tend to push it forward, while on the undulatory theory there seemed no reason why any effect of this kind should take place. Indeed, in 1792 this very point was regarded as a test between the theories, and Bennet made experiments to see whether or not he could find any traces of this pressure. We now know that the pressure is there, and if Bennet's instrument had been more sensitive he must have observed it. It is perhaps fortunate that Bennet had not at his command more delicate apparatus. Had he discovered the pressure of light it would have shaken confidence in the undulatory theory and checked that magnificent work at the beginning of the last century which so greatly increased our knowledge of optics.

[After referring to the recent remarkable series of investigations on the thermodynamics of radiation, Professor Thomson pointed out that the principles that radiation is made up of units and that it requires a unit possessing a definite amount of energy to excite radiation in a body on which it falls, receive perhaps their best illustration in the remarkable laws governing secondary Roentgen radiation recently discovered by Professor Barkla. Professor Barkla has found that each of the different chemical elements, when exposed to Roentgen rays, emit a definite type of secondary radiation, whatever may have been the type of primary, thus lead emits one type, copper another, and so on; but these radiations are not excited at all if the primary radiation is of a softer type than the specific radiation emitted by the substance; thus the secondary radiation from lead is harder than that from copper, and if copper is exposed to the secondary radiation from lead the copper will radiate, but lead will not radiate when exposed to copper. If we suppose, therefore, that the energy in a unit of hard Roentgen rays is greater than in one of soft, Barkla's results are strikingly analogous to those which would follow on the unit theory of light. Professor Thomson then passed to a very brief consideration of "one of the most important and interesting advances ever made in physics, and in which Canada, as the place of the labours of Professor Rutherford and Professor Soddy, has taken a conspicuous part." He continued:—]

I mean the discovery and investigation of radio-activity. Radio-activity was brought to light by the Roentgen rays. One of the many remarkable properties of these rays is to excite phosphorescence in certain substances, including the salts of uranium, when they fall upon them. Since Roentgen rays produce phosphorescence, it occurred to Becquerel to try whether phosphorescence would produce Roentgen rays. He took some uranium salts which had been made to phosphoresce by exposure, not to Roentgen rays but to sunlight, tested them, and found that they gave out rays possessing properties similar to Roentgen rays. Further investigation showed, however, that to get these rays it was not necessary to make the uranium phosphoresce, that the salts were just as active if they had been kept in the dark. It thus appeared that the property was due to the metal and not to the phosphorescence, and that uranium and its compounds possessed the power of giving out rays which, like Roentgen rays, affect a photographic plate, make certain minerals phosphoresce, and make gases through which they pass conductors of electricity. Niepce de Saint-Victor had observed some years before this discovery that paper soaked in a solution of uranium nitrate affected a photographic plate, but the observation excited but little interest. The ground had not then been prepared, by the discovery of the Roentgen rays, for its reception, and it withered and was soon forgotten. Shortly after Becquerel's discovery of uranium, Schmidt found that thorium possessed similar properties. Then Monsieur and Madame Curie, after a most difficult and laborious investigation, discovered two new substances, radium and polonium, possessing this property to an enormously greater extent than either thorium or uranium, and this was followed by the discovery of actinium by Debierne. Now the researches of Rutherford and others have led to the discovery of so many new radio-active substances that any attempts at christening seems to have been abandoned, and they are denoted, like policemen, by the letters of the alphabet.

Mr. Campbell has recently found that potassium, though far inferior in this respect to any of the substances I have named, emits an appreciable amount of radiation, the amount depending only on the quantity of potassium, and being the same whatever the source from which the potassium is obtained or whatever the elements with which it may be in combination. The radiation emitted by these substances is of three types, known as α, β, and γ rays. The α rays have been shown by Rutherford to be positively electrified atoms of helium, moving with speeds which reach up to about one-tenth of the velocity of light. The β rays are negatively electrified corpuscles, moving in some cases with very nearly the velocity of light itself, while the γ rays are unelectrified, and are analogous to the Roentgen rays. The radio-activity of uranium was shown by Crookes to arise from something mixed with the uranium, and which differed sufficiently in properties from the uranium itself to enable it to be separated by chemical analysis. He took some uranium, and by chemical treatment separated it into two portions, one of which was radio-active and the other not. Next Becquerel found that if these two portions were kept for several months the part which was not radio-active to begin with regained radio-activity, while the part which was radio-active to begin with had lost its radio-activity. These effects and many others receive a complete explanation by the theory of radio-active change which we owe to Rutherford and Soddy. According to this theory the radio-active elements are not permanent, but are gradually breaking up into elements of lower atomic weight; uranium, for example, is slowly breaking up, one of the products being radium, while radium breaks up into a radio-active gas called radium emanation, the emanation into another radio-active substance, and so on, and that the radiations are a kind of swan's song emitted by the atoms when they pass from one form to another; that, for example, it is when a radium atom breaks up and an atom of the emanation appears that the rays which constitute the radio-activity are produced. Thus, on this view the atoms of the radio-active elements are not immortal; they per [illegible] life whose average value ranges from thousands of [illegible] years in the case of uranium to a second or so in [illegible] the gaseous emanation from actinium. When the atoms pass from one state to another they give out large stores of energy; thus their descendants do not inherit the whole of their wealth of stored-up energy, the estate becomes less and less wealthy with each generation; we find, in fact, that the politician, when he imposes death duties, is but imitating a process which has been going on for ages in the case of these radio-active substances.

Many points of interest arise when we consider the rate at which the atoms of radio-active substance disappear. Rutherford has shown that whatever be the age of these [illegible] atoms which disappear in one [illegible] another way of putting it is that [illegible] atom is independent of its age—that an atom of radium 1000 years old is just as likely to live for another thousand years as one just sprung into existence. Now this would be the case if the death of the atom were due to something from outside which struck old and young indiscriminately; in a battle, for example, the chance of being shot is the same for old and young; so that we are inclined at first to look to something coming from outside as the cause why an atom of radium, for example, suddenly changes into an atom of the emanation. But here we are met with the difficulty that no changes in the external conditions that we have as yet been able to produce have had any effect on the life of the atom; as far as we know at present the life of a radium atom is the same at the temperature of a furnace as at that of liquid air—it is not altered by surrounding the radium by thick screens of lead or other dense materials to ward off radiation from outside; and what to my mind is especially significant, it is the same when the radium is in the most concentrated form, when its atoms are [illegible] the rays given off [illegible] in the most dilute [illegible] the water which separates one atom from another. This last result seems to me to make it somewhat improbable that we shall be able to split up the atoms of the non-radio-active elements by exposing them to the radiation from radium; if this radiation is unable to affect the unstable radio-active atoms, it is somewhat unlikely that it will be able to affect the much more stable non-radio-active elements.

The evidence we have at present is against a disturbance coming from outside breaking up of the radio-active atoms, and we must therefore look to some process of decay in the atom itself; but if this is the case, how are we to reconcile it with the fact that the expectation of life of an atom does not diminish as the atom gets older? We can do this if we suppose that the atoms when they are first produced have not all the same strength of constitution, that some are more robust than others, perhaps because they contain more intrinsic energy to begin with, and will therefore have a longer life. Now if when the atoms are first produced there are some which will live for one year, some for ten, some for a thousand, and so on; and if lives of all durations, from nothing to infinity [illegible] that the number of atoms [illegible] a certain number of years [illegible] for each additional year of life, we can easily prove that the expectation of life of an atom will be the same whatever its age may be. On this view the different atoms of a radio-active substance are not in all respects identical.

The energy developed by radio-active substances is exceedingly large, one gramme of radium developing nearly as much energy as would be produced by burning a ton of coal. This energy is mainly in the α particles, the positively charged helium atoms which are emitted when the change in the atom takes place; if this energy were produced by electrical forces it would indicate that the helium atom had moved through a potential difference of about two million volts on its way out of the atom of radium. The source of this energy is a problem of the deepest interest; if it arises from the repulsion of similarly electrified systems exerting forces varying inversely as the square of the distance, then to get the requisite amount of energy the systems, if their charges were comparable with the charge on the α particle, could not when they start be further apart than the radius of a corpuscle, 10^{-13} centimetres. If we suppose that the particles do not acquire this energy at the explosion, but [illegible] they are shot out of the radium atom they move [illegible] with the speed with which they [illegible] to prevent particles moving with this velocity from flying off at a tangent are so great that finite charges of electricity could only produce them at distances comparable with the radius of a corpuscle.

One method by which the requisite amount of energy could be obtained is suggested by the view to which I have already alluded—that in the atom we have electrified systems of very different types, one small, the other large; the radius of one type [illegible] 10^{-13} centimetres, that of the other [illegible] The electrostatic potential [illegible]es is enormously greater than that in the larger ones; if one of [illegible] explode and expand to the size of [illegible]ration of energy large [illegible] the energy it possesses. Is it possible that the [illegible] of electricity were, to begin with, quite as small as the negative, but while in the course of ages most of these have passed from the smaller stage to the larger, there are some small ones still lingering in radio-active substances, and it is the explosion of these which liberates the energy set free during radio active transformation?

The properties of radium have consequences of enormous importance to the geologist as well as to the physicist or chemist. In fact, the discovery of these properties has entirely altered the aspect of one of the most interesting geological problems, that of the age of the earth. Before the discovery of radium it was supposed that the supplies of heat furnished by chemical changes going on in the earth were quite insignificant, and that there was nothing to replace the heat which flows from the hot interior of the earth to the colder crust. Now when the earth first solidified it only possessed a certain amount of capital in the form of heat, and if it is continually spending this capital and not gaining any fresh heat it is evident that the process cannot have been going on for more than a certain number of years, otherwise the earth would be colder than it is. Lord Kelvin in this way estimated the age of the earth to be less than 100 million years. Though the quantity of radium in the earth is an exceedingly small fraction of the mass of the earth, only amounting, according to the determinations of Professor Strutt and Professor Joly, to about five grammes in a cube whose side is 100 miles, yet the amount of heat given out by this small quantity of radium is so great that it is more than enough to replace the heat which flows from the inside to the outside of the earth. This, as Rutherford has pointed out, entirely vitiates the previous method of determining the age of the earth. The fact is that the radium gives out so much heat that we do not quite know what to do with it, for if there was as much radium throughout the interior of the earth as there is in its crust, the temperature of the earth would increase much more rapidly than it does as we descend below the earth's surface. Professor Strutt has shown that if radium behaves in the interior of the earth as it does at the surface, rocks similar to those in the earth's crust cannot extend to a depth of more than 45 miles below the surface.

It is remarkable that Professor Milne from the study of earthquake phenomena had previously come to the conclusion that rocks similar to those at the earth's surface only descend a short distance below the surface; he estimates this distance at about 30 miles, and concludes that at a depth greater than this the earth is fairly homogeneous. Though the discovery of radio-activity has taken away one method of calculating the age of the earth it has supplied another. The gas helium is given out by radio-active bodies, and since, except in beryls, it is not found in minerals which do not contain radio-active elements, it is probable that all the helium in these minerals has come from these elements. In the case of a mineral containing uranium, the parent of radium in radio-active equilibrium, with radium and its products, helium will be produced at a definite rate. Helium, however, unlike the radio-active elements, is permanent and accumulates in the mineral; hence if we measure the amount of helium in a sample of rock and the amount produced by the sample in one year we can find the length of time the helium has been accumulating, and hence the age of the rock. This method, which is due to Professor Strutt, may lead to determinations not merely of the average age of the crust of the earth, but of the ages of particular rocks and the date at which the various strata were deposited; he has, for example, shown in this way that a specimen of the mineral thorianite must be more than 240 million years old.

The physiological and medical properties of the rays emitted by radium is a field of research in which enough has already been done to justify the hope that it may lead to considerable alleviation of human suffering. It seems quite definitely established that for some diseases, notably rodent ulcer, treatment with these rays has produced remarkable cures; it is imperative, lest we should be passing over a means of saving life and health, that the subject should be investigated in a much more systematic and extensive manner that there has yet been either time or material for. Radium is, however, so costly that few hospitals could afford to undertake pioneering work of this kind; fortunately, however, through the generosity of Sir Ernest Cassel and Lord Iveagh a radium institute, under the patronage of His Majesty the King, has been founded in London for the study of the medical properties of radium, and for the treatment of patients suffering from diseases for which radium is beneficial. The new discoveries made in physics in the last few years, and the ideas and potentialities suggested by them, have had an effect upon the workers in that subject akin to that produced in literature by the Renaissance. Enthusiasm has been quickened, and there is a hopeful, youthful, perhaps exuberant, spirit abroad which leads men to make with confidence experiments which would have been thought fantastic 20 years ago. It has quite dispelled the pessimistic feeling, not uncommon at that time, that all the interesting things had been discovered, and all that was left was to alter a decimal or two in some physical constant. There never was any justification for this feeling, there never were any signs of an approach to finality in science. The sum of knowledge is at present, at any rate, a diverging not a converging series. As we conquer peak after peak we see in front of us regions full of interest and beauty, but we do not see our goal, we do not see the horizon; in the distance tower still higher peaks, which will yield to those who ascend them still wider prospects, and deepen the feeling, whose truth is emphasised by every advance in science, that "Great are the Works of the Lord."

EXPERIENCES IN THE TREATMENT OF DISTAL PARALYSES BY NERVE ANASTOMOSIS.[1]

BY A. H. TUBBY, M.S. LOND., F.R.C.S. ENG.,

SURGEON TO THE ROYAL NATIONAL ORTHOPÆDIC HOSPITAL AND THE WESTMINSTER HOSPITAL; CONSULTING SURGEON TO THE EVELINA HOSPITAL FOR SICK CHILDREN.

WHEN a new procedure is introduced its justification largely depends upon the selection of suitable cases and a keen determination to avoid possible sources of fallacy. Therefore before we decide upon so radical an operation as nerve anastomosis we must be sure that irrecoverable paralysis is present. To take an example—anterior poliomyelitis. Muscles which appear to be hopelessly inert will under appropriate treatment show signs of recovery. By appropriate conditions we mean rest, relaxation of tension thrown upon them by secondary deformity, and the use of massage and electricity. Therefore it may be definitely laid down that no case of paralysis is suitable for nerve grafting until the usual remedial means just indicated have been continuously carried out under skilled observation for at least three months, and until it is quite clear that faradic excitability of the muscles is entirely lost. It is impossible when a case first comes under observation to forecast what amount of recovery will take place with electrical and mechanical treatment. I have many times taken cases into hospital which appeared to be eminently suitable for the operation, but after three months' systematic treatment it was found that such a degree of recovery had taken place as to render surgical interference unnecessary. In the instances shortly to be related all sources of fallacy of the nature just alluded to have been avoided.

The literature of nerve grafting is extensive, and is to be found in my publications, in the *Medical Annual* and elsewhere. But mention must be made of the pioneer work of Langley, Sherrington, Sherren, and especially of Kilvington, whose researches on dogs have not only been of service in indicating the lines of procedure, but have also by their success encouraged us to apply them to surgery. Honourable mention must be made of Spitzy, Young of Philadelphia, and of Peckham, but in regard to Kennedy special mention is called for, because he showed that when the flexor and extensor nerve supply of a limb are interchanged, stimulation of the cortical flexor-centre produces extension and *vice versâ*, thus proving that the nature of the movement depends not on the cortical cells but on the terminal arrangement of the nerves and muscles. The cortical centre supplies the muscles, whilst the nature of the movement is governed by the distribution of the nerves and the origin and insertion of the muscles.

The types of paralyses for which I have performed anastomosis are (1) traumatic and (2) infantile paralysis. The total number of cases operated upon is eight. These cases have been watched for a period of not less than three years since the operation, and therefore we are now able to report the result after a prolonged period of observation.

---

[1] A paper read at the International Medical Congress held at Budapest, 1909.

They have also been demonstrated at the Clinical Society of London and the Royal Society of Medicine.

I.—TRAUMATIC CASES.

CASE 1. *Facio-hypoglossal anastomosis following an operation.*—A man, aged 19 years, was admitted under my care into Westminster Hospital on Oct. 3rd, 1905, suffering from facial paralysis, which had followed the opening of a glandular abscess just behind the jaw. The surgeon had made a vertical incision, and completely divided the facial nerve just behind the ascending ramus of the jaw six months previously. The left side of the face was completely paralysed, and there was no response whatever to faradic stimulation. The left angle of the mouth dropped, the tongue deviated to the right, and he had lost the sensation of taste on the anterior part of the left side of the tongue. Epiphora of the left eye was present, and he dribbled somewhat from the left side of the mouth. He was unable to close the left eye at all, food accumulated in the left cheek, and when he smiled the mouth was drawn over to the right side. It was noticed that the hair grew more abundantly on the left than on the right side.

On Oct. 16th an incision was made from the tip of the mastoid process to the greater cornu of the hyoid bone, and a dissection was undertaken to find the distal part of the facial nerve. It was evident that it had been severed subsequently to its division into two main trunks, the cervico- and temporo-facial. With great difficulty these two nerve trunks were found, and the hypoglossal nerve was then exposed. The digastric and stylohyoid muscles were then removed, and the hypoglossal nerve pulled well up until it approximated to the distal facial trunks. Two small incisions were then made into the shaft of the hypoglossal nerve, and the facial trunks were inserted and stitched in place. The head and neck were fixed in plaster-of-Paris so as to permit no tension whatever being put upon the anastomosis. One week after the operation signs of recovery appeared. The patient could partially close the left eye. Gradually all the paralysed muscles recovered their power, and when the case was shown before the Royal Society of Medicine of London in March, 1909, it was difficult to distinguish which side of the face had been affected, except that there was a very slight droop at the left angle of the mouth. All movements and functions were perfect. It was also noticed that there was a total absence of associated movements of the tongue and face, that the left half of the tongue was not wasted, and that the tongue could be protruded directly without any deviation.

CASE 2. *Severe laceration of the supraclavicular part of the* [illegible] *the right arm; nerve* [illegible] ged 25 years, a sailor, [illegible] ust 20th, 1905, he was thrown against the bulwarks of a Transatlantic liner. He was picked up unconscious, and the right arm was limp and flaccid. When the ship arrived at New York the patient was still unconscious. He was taken to a hospital there and was trephined over the Rolandic area under the impression that he was suffering from meningeal hæmorrhage, but the trephining operation was unsuccessful in relieving his symptoms. When the patient recovered consciousness he noticed that the right supraclavicular region was much bruised and swollen. When he came under my care in January, 1906, he had complete flaccid paralysis of the right arm, including the pectorales, but not the serratus magnus nor the trapezius. There was complete anæsthesia of the limb except over the area supplied by the intercosto-humeral nerve. Faradic excitability was entirely lost.

An operation was performed by me on Feb. 12th, and the whole length of the brachial plexus from the spine to the lower part of the anterior axillary fold was exposed. The supraclavicular portion of the plexus was found to be involved in a dense mass of fibrous tissue. All this was dissected away and the cords entirely freed. In the uppermost part of the fifth nerve cord a fibro-neuroma was found. This was removed, and the distal part of the fifth nerve cord was grafted into the sixth. The condition of the other cords appeared to be healthy, and it was thought that the paralysis below might be due to compression by scar tissue. No signs of improvement followed until March 12th, 1908, when return of power in the biceps was noted, so that he could flex the forearm to the right angle. There was also some recovery in the deltoid, and it responded to faradic stimulation. On March 12th, 1909, the biceps and brachialis anticus had completely recovered, so that he had full power of flexion of the forearm; and the deltoid acted, so that he could draw his arm away from the side for about four inches. The biceps, though smaller than the one on the opposite side, was of considerable size and became firm and solid when in motion, and the fibres of the deltoid could be felt to harden when attempts were made to abduct the arm. With regard to sensation, it was found to be present all over the skin of the upper arm down to the elbow; although it was poorly marked on the lower half of the outer side, sensation was present in the following areas: (*a*) the cutaneous branches of the circumflex nerve derived from the fifth and sixth cervical nerves; (*b*) the upper external cutaneous branch of the musculo-spiral, derived from the sixth and seventh cervical roots; (*c*) the internal branch of the musculo-spiral, derived from the fifth root; (*d*) the lesser internal cutaneous nerve, derived from the sixth (?) cervical root; and (*e*), as we have before mentioned, over the intercosto-humeral nerve, derived from the second dorsal root. So that the recovery of motor power is limited to the biceps, brachialis anticus, and partially to the deltoid, but the supinator longus does not respond, nor do the muscles below the elbow. Sensation is gradually advancing down the arm.

II.—NERVE ANASTOMOSIS FOR INFANTILE PARALYSIS.

CASE 3. *Partial loss of power in arm due to infantile paralysis.*—A boy, aged nine years, came under my observation on Nov. 21st, 1906, with the history of an attack of infantile paralysis in September, 1906, which resulted in partial loss of power in the left arm. He was seen by me on Nov. 21st, 1906. The left arm hung by the side, but the elbow and wrist could be flexed. The deltoid, supra- and infra-spinatus, and biceps and supinator longus were wasted and did not respond to faradic stimulation. He could flex and extend the elbow, however, with the remaining muscle attached to the internal and external condyles. He was treated by massage and the constant and faradic currents, but no improvement followed.

On May 22nd, 1907, the condition of paralysis remained *in statu quo ante*, and it was decided to graft the anterior branch of the fifth cervical nerve into the sixth. This was done on May 27th. The fifth cord was divided, and both its proximal and distal ends inserted into the sixth about half an inch apart. Massage and the faradic and constant currents were used daily. No improvement was noted for one year. On May 20th, 1908, it was noted that contraction had appeared in the biceps, and that the muscle was fuller and firmer; also that the posterior part of the deltoid was active and that the fibres were developing. On May 14th, 1909, the improvement in the biceps was seen to be steadily continuous though slow, and the deltoid was firmer and more active.

[illegible] *deltoid muscle.*—A boy, [illegible] into Westminster [illegible] deltoid. At the age of ten years he had an illness, and then it was found he [illegible] Massage and electricity had [illegible] hree years before he came [illegible] y result. The deltoid was [illegible] to respond to any faradic stimulation.

The brachial plexus was exposed, and, assisted by Mr. E. Rock Carling, I determined by means of sterilisable electrodes which portion of the fifth nerve cord was paralysed. It was found that a weak stimulus, applied to the internal portion of the cord, caused contraction of the biceps, supinator longus, and extensor carpi radialis longior, but when the current was applied to the outer portion of the cord no effect was observable. It was therefore concluded that the fibres supplying the deltoid lay in the upper and outer portion of the cord. It was therefore divided half-way through its thickness and then longitudinally downwards for an inch, so that the nerve fibres of the deltoid could be brought over to the sixth nerve. In the sheath of the latt [illegible] and the free end of the [illegible] inserted and sutured. [illegible] deltoid responded to faradic stimulation. The muscles had increased in size, had become firm, and could be felt to harden when voluntary movement was attempted. 18 months after the operation the boy could abduct the limb six inches from the side, and two years after the operation about eight inches. Since then the boy has been lost sight of, but from the experience of previous cases we have reason to believe that the recovery will be continuous.

III.—OPERATIONS ON THE POPLITEAL NERVES FOR VARIOUS FORMS OF PARALYTIC TALIPES.

From their anatomical arrangements the external and internal popliteal nerves afford peculiar facilities for nerve grafting, and Kilvington's experiments on dogs, when operating on the popliteal space, have been remarkably successful. I now give details of four cases of this nature.

CASE 5. *Paralytic talipes calcaneus due to anterior poliomyelitis; nerve anastomosis; partial recovery.*—A boy, aged nine years, was admitted to Westminster Hospital on May 19th, 1905, under my care. He had an attack of anterior poliomyelitis when aged two and a half years. He had been treated by massage and electricity for three years previously to my seeing him. Examination showed total paralysis of the gastrocnemius and soleus.

On June 5th the internal and external popliteal nerves were exposed. The branches of the gastrocnemius and soleus from the internal popliteal nerve were identified; and were separated from this nerve trunk and grafted on to the external. On Oct. 1st it was noted that voluntary extension of the ankle had commenced, and the tendo Achillis could be felt to become tense during this movement. The power of plantar flexion of the foot steadily increased until he was able to bend the toes fully. When he walked he could raise the heel from the ground. At this date (May, 1909) the gastrocnemius and soleus on the left side have not recovered power sufficiently to enable him to raise the whole weight of the body by their effort.

CASE 6. A boy, aged nine years, was admitted into Westminster Hospital on Oct. 21st, 1905, suffering from talipes calcaneus due to anterior poliomyelitis. He had been treated by massage and electricity for the previous three months with no improvement whatsoever, and the foot was in a position of marked talipes calcaneus, with great contraction of the plantar fascia. The electrical reactions showed that all the muscles of the left leg below the knee reacted to faradism except the gastrocnemius and soleus.

On Nov. 13th an operation precisely similar to that performed in the preceding case was carried out. On Dec. 5th it was noted that there was some tension in the tendo Achillis when voluntary movement was attempted, and on Jan. 9th, 1906, he could raise the heel, and the tendo Achillis could be felt to harden when resistance was opposed to the foot. On Jan. 31st the voluntary movement of the heel upward was more marked. On May 9th it was noticed that he could flex and extend the left ankle well when the foot was off the ground. On March 13th, 1907, it was found that the gastrocnemius and soleus reacted to the faradic current, whilst with the galvanic current K.C.C.>A.C.C. When the foot was plantar-flexed it required a considerable effort on the part of the observer to overcome the contraction of the gastrocnemius and soleus, and the tension of the tendo Achillis was very considerable. The range of ankle movement had become almost normal, but he was not able to raise the whole weight of the body on the affected foot, but the heel was well raised in walking. In this case the improvement has been continuous both as to the strength of the muscles and the mode of walking, but there is still room for further recovery of the muscles.

The two following cases are illustrations of nerve anastomosis carried out for paralytic varus.

CASE 7. *Talipes varus due to anterior poliomyelitis; nerve anastomosis.*—A boy, aged seven years, was admitted on Sept. 17th, 1905, with talipes varus dating from the age of two years, affecting the left leg. The leg was wasted and there was loss of power below the knee, particularly marked in the peroneal muscles, which gave the reaction of degeneration.

On July 3rd, 1906, after prolonged treatment by massage and electricity, an operation was performed. The external and internal popliteal nerves were dissected out. The external nerve was then divided completely across, and both the distal and proximal ends inserted into the internal popliteal nerve at a distance of about one inch from each other. In this case no improvement has followed, this being doubtless due to the fact that considerable degeneration had
already taken place in the internal popliteal nerve trun
and a fuller recognition of this fact would have prevent
any attempt at nerve grafting.

CASE 8. *Paralytic talipes equino-varus of poliomyeli*
origin, dating from the age of 18 months.—It was found
testing the muscles that the anterior tibial and the peror
muscles were completely paralysed and showed the reacti
of degeneration.

By way of treatment preliminary to nerve anastomosis t
plantar fascia and tendo Achillis were divided. On July 31
1905, a nerve anastomosis operation was undertaken in t
popliteal space. The internal and external popliteal trun
were exposed, the external one divided completely acro
and its distal end inserted into the internal. No improv
ment was noted for two years, and then a second operati
was undertaken in May, 1908, for the purpose of ascertaini
the condition of the anastomosed nerve. It was then fou
that the distal portion of the external popliteal nerve bel
the site of anastomosis was undergoing regeneration,
evidenced by an increase in size as compared with t
proximal part, and by its whiteness, roundness, and firmne
and it was further found that faradic stimulation of t
distal portion caused contraction of the anterior and exter
group of muscles. In this instance the progress of regene
tion is extremely slow, but the outlook is hopeful.

We may learn from a consideration of these cases that t
time when regeneration occurs is extremely variable. In t
facio-hypoglossal anastomosis signs were evident one we
after the operation, but in this case paralysis had o
existed for six months. My conclusion is that the long
paralysis has existed before the operation the slower will
the signs of recovery in appearing. We must not theref
regard a case as hopeless, even if no evidence of regene
tion is present three years after the operation. The appe
ances detailed in the last case we have quoted were rema
ably encouraging.

To sum up these cases, we must remark that they are
widely different causation. Of the eight cases quoted, t
were of traumatic origin and one recovered after comple
severance of the nerve, and one is showing steady progre
towards recovery. Of the cases due to anterior poli
myelitis, six in number, in four there is distinct evidence
a more than partial recovery of the muscles, but in one
these cases improvement has ceased for a year. In t
others no clinical signs of regeneration are apparent, ev
after four years. In one of the latter operative explorati
showed, however, that the external popliteal nerve was bei
regenerated centrifugally.

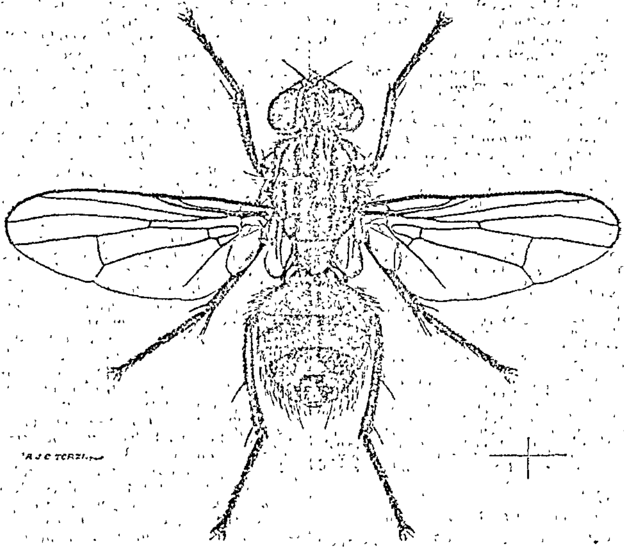
Harley-street, W.

A POSSIBLE NATURAL ENEMY TO TH MOSQUITO.

BY J. MITFORD ATKINSON, M.B. LOND.,
PRINCIPAL CIVIL MEDICAL OFFICER, HONG-KONG.

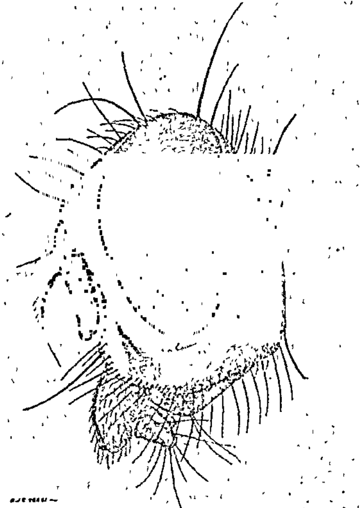
IN the summer of 1908 it was reported to me by M
Gibson, the colonial veterinary surgeon of Hong-Kong, th
he and Inspector Watson had seen flies eating mosqui
larvæ in the nullah and streams adjacent to the cattle dep
at Kennedy Town in that colony. I had some of the
collected and sent to the Tropical School of Medicin
London, where they were recognised by Colonel Alcoc
the entomologist, as belonging to the Dolichopodides, man
of the species of which family have well-known aquat
propensities; they were, however, too much damaged o
arrival to be specifically identified. As Colonel Alcock ask
for more specimens I went to collect some, but th
rains had washed all the larvæ away, and, the cool weathe
soon after setting in, it was impossible to obtain any tha
season. This summer, towards the end of April,
went to Kennedy Town with Mr. Gibson and we sa
hundreds of flies eating larvæ in the nullah and als
in the streams near by. On stirring up the stagnan
water at the sides of the nullah crowds of larvæ were dis
turbed; the flies pounced down upon them and rapidl
devoured larvæ almost as long as their own bodies. At time
they would fly away with the larvæ in their mouths. Thes
were evidently all of the same species. Some were collecte
and sent home and have been identified by Mr. E. E. Austen
the Dipterologist at the British Museum (Natural History), a

FIG. 1.



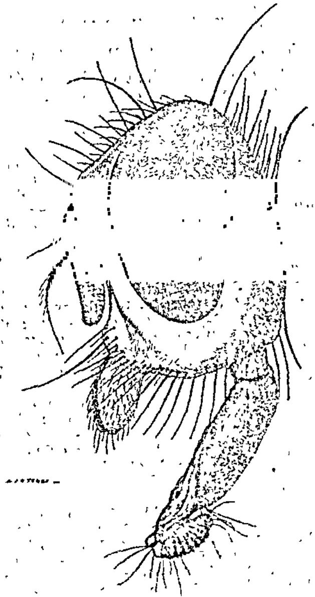
Lispa Sinensis (Schiner).

FIG. 2.



The head in profile, showing proboscis within the mouth cavity.

FIG. 3.



The head in profile, showing proboscis extended.

belonging to the species *Lispa Sinensis*, *Schiner*, of the family of *Anthomyidæ*, or flower flies. Since my return to England I have seen Mr. Austen and he says this discovery is a most interesting one, and, so far as he knows, entirely new. On his advice I have had drawings of the fly made by Mr. A. J. Engel Terzi, since accuracy is of the first importance.

In examining the two specimens which I sent, and which are now at the British Museum, Mr. Terzi found the mouth parts very peculiar both in size and shape. All the species of this genus have the same characteristics The proboscis is very short and chitinous, and the palpi are of a peculiar shape; they are very much like spoons. The illustrations show (Fig. 1) the whole insect; (Fig. 2) the head in profile, with the proboscis within the mouth cavity; and (Fig. 3) the head in profile, with the proboscis fully extended. I give herewith a brief description of the fly kindly sent me by Mr. Austen:—

Lispa Sinensis, Schiner.—Female—Length (two specimens) 6 5 to 7 millimetres; width of head, 2 millimetres; width of front at vertex, 1 millimetre; length of wing, 6 millimetres. *Olivaceous-grey bristles and hair black; dorsum of abdomen somewhat lighter than that of thorax; second and two following segments of abdomen each with a pair of curved, dark olive marks on dorsum, the marks on second and third segments twice the breadth of those on fourth segment.*

Head: face and sides of front golden yellow; frontal stripe broad, *dusky clove-brown; palpi greyish ochraceous buff, broadly spatulate at* tips; antennæ greyish-black.

Thorax: dorsum with three longitudinal clove-brown stripes, the median stripe entire, the admedian stripes not quite reaching the præsutural furrow; a similar but less conspicuous stripe on each side above humeral callus, not extending far beyond transverse suture.

Abdomen: dark marks on dorsum of second and following segments start from front margin in each case close to middle line, and curve outwards towards posterior angles, which, however, they do not reach; the marks on fourth segment are shorter than those on the two preceding segments.

Wings: slightly infuscated.

Halteres: ochraceous-buff.

Legs black; femora grey.—E. E. AUSTEN (July 26th, 1909).

Further investigation is required in order to ascertain whether there are two predaceous flies in Hong-Kong and also the exact larvæ on which these flies are predaceous. As I left for England on May 4th it was impossible to determine the exact larvæ on which the Lispa Sinensis were then feeding, but Mr. Gibson is positive that he has seen them preying on mosquito larvæ.

A CASE OF "DELAYED CHLOROFORM POISONING" TREATED WITH DEXTROSE; RECOVERY.

By A. A. WEIR, M.B., B S.

THE patient, a boy, aged nine years, was seen by me on Dec. 16th, 1908, complaining of "pains in the stomach." Three days previously he had eaten a considerable quantity of uncooked broad beans. The pains had come on on the following day and there was a good deal of vomiting. The temperature was 100° F.; there was some general abdominal tenderness, but nothing to indicate definitely appendical trouble. The vomiting persisted and all that could be retained was a little milk. On Dec. 19th everything pointed to the appendix as the source of trouble, and on the 20th I concluded that pus was present. Dr. P. H. Lang, of Camperdown, saw the case with me on this day and agreed with the diagnosis. With Dr. Lang's assistance I opened the abdomen and drained an abscess which extended down into the pelvis. The anæsthetic administered was chloroform, which was taken exceedingly well, the time occupied being about three-quarters of an hour. After the operation the patient was restless and complained a good deal of thirst, but he vomited once only and that was 12 hours afterwards. Saline solution was administered per rectum on account of the thirst. For 48 hours the patient seemed well, except for the restlessness; the temperature was normal and the pulse quite good. The condition as far as the operation was concerned seemed so good that one felt inclined to attribute the restlessness to the boy's disposition. On the following day, however, the restlessness had become a maniacal delirium, the patient screamed, threw the clothes about, tore off his dressings, and had to be placed under mechanical restraint. By this time I had decided that the case was one either of "acute post-operative mania," or "delayed chloroform poisoning." The almost entire absence of vomiting seemed in striking contrast to all reported cases of delayed chloroform poisoning, but I was inclined to favour the latter diagnosis and administered sodium bicarbonate by rectal injection. Dr. Lang again saw the case with me on the third day after operation, when the patient was alternately delirious and comatose. The urine showed diacetic acid when tested with liquor ferri perchlor., and although the quantity of urine was not measured it was judged by the nurse to be about normal; there was no albumin. Dr. Lang and I decided to continue the rectal injections and sodium bicarbonate; and acting on a suggestion made by Dr. A. P. Beddard in THE LANCET of March 14th, 1908, p. 782, a solution of glucose, half an ounce to half a pint of milk, was administered by the nasal tube and a 10 per cent. solution by the rectum. This was given four hourly, in addition to a good supply of carbohydrate food. For the next 20 hours the case went from bad to worse, the face became a rich plum colour, the coma deepened, frothy saliva oozed from the mouth, and the prognosis seemed absolutely hopeless. Typical Cheyne-Stokes respiration was present, and the sweating was profuse. The pulse, however, remained good, and was never above 108 per minute, and the patient retained everything given by the nasal tube and per rectum. After remaining in this desperate-looking condition for a few hours he began to show a little improvement, the first sign being an attempt to move his head. Within six hours from this first sign of improvement the change was nothing short of marvellous, and the prognosis from seeming absolutely bad seemed absolutely good. Within six hours, in fact, the boy's intellect was quite clear and he expressed a wish for some food. Recovery was perfect.

The case is interesting from several points of view. The diagnosis seems fairly well established, but if it were correct the absence of vomiting is not easily accounted for considering that in practically all cases reported vomiting is by far the most constant and prominent symptom. The treatment unfortunately leaves some doubt as to whether the sodium bicarbonate or the glucose and carbohydrate was the chief element making for success in the case. The rapid improvement within 24 hours of the first administration of glucose solution, in conjunction with the fact that sodium bicarbonate had been given over 24 hours previously, would perhaps indicate that the glucose was the principal factor contributing to the favourable result. The comparatively gradual onset of the symptoms also seems uncommon in these cases, for although the boy was always more or less restless after the operation it was well into the third day before the case looked alarming in any way. It is unfortunate that the urine was not examined earlier for diacetic acid; the reaction for this compound rapidly disappeared as the case improved.

It should be added that the patient previously to operation was quite healthy. He had had chloroform four years before for the removal of adenoids without any untoward result. One sister in a family of nine had died from tuberculous meningitis; otherwise the family history was good.

Terang, Victoria, Australia.

THE VACUOLATION OF THE BLOOD PLATELETS: AN EXPERIMENTAL PROOF OF THEIR CELLULAR NATURE.[1]

By HUGH C. ROSS, L.R.C.P. LOND., M.R.C.S. ENG.,
LATE SURGEON, ROYAL NAVY; DIRECTOR OF PATHOLOGICAL RESEARCH AT THE ROYAL SOUTHERN HOSPITAL, LIVERPOOL.

ON July 27th, 1907, a paper appeared in THE LANCET by Ronald Ross, J. E. S. Moore, and C. E. Walker entitled "A New Microscopical Diagnostic Method and Some Simple Methods for Staining Liquid Blood." It described new methods for the staining of blood cells *in vitro*—notably the agar jelly method—by mixing polychrome methylene blue with agar and preparing a film; blood cells spread upon this will absorb the stain, and if the jelly is suitably prepared the different morphological elements of the cells can be readily distinguished. It also described how the leucocytes, after they had been resting on the jelly for a short time, developed bright red spots in their cytoplasm, and it was suggested that the spots might be centrosomes. The spots appear as bright scarlet points, and resemble closely what one would imagine that centrosomes would look like if they [illegible] leucocytes The "red [illegible] in the blood platelets, [illegible] s the authors suggested in their paper in THE LANCET that if they could be demonstrated in the blood platelets it would settle the nature of these bodies and close an old-existing controversy.

---

[1] A paper read recently before the Royal Society.

About two months ago I was fortunate enough to observe these "red spots" in the blood platelets, and if the following experiment is repeated the spots can be produced in them in every specimen. Prepare a neutral solution which contains 3 per cent. sodium citrate, 1 per cent. sodium chloride, and 1 per cent. morphine hydrochloride. Draw up into a capillary tube a volume of this solution, and add to it an equal volume of blood drawn freshly from the finger. After allowing the two fluids to mix incubate the tube at 37° C. for five hours. A film of agar jelly must now be prepared which contains a sufficiency of Unna's stain to stain deeply the granules of polymorphonuclear leucocytes when they are spread upon it. One suitable formula for preparing this jelly is given in THE LANCET of Jan. 16th and Feb. 6th, 1909, and another suitable formula will be found in the first equation in a paper recently published in the Proceedings of the Royal Society, B, Vol. LXXXI., 1909, p 102. Place a drop of the incubated blood and morphine solution on to a cover-glass, which should be inverted and allowed to fall flat on to the agar film In about 15 minutes' time it will be seen that probably all the blood platelets will show one or more bright red spots in them, and these spots are identical in appearance (except that they are usually smaller) with those seen in the cytoplasm of leucocytes when blood is examined by this *in vitro* method by which the spots in the larger cells were observed by R. Ross, Moore, and Walker. It is, however, necessary to state that the spots are not centrosomes. At first I believed them to be such, but further investigation showed the suggestion to be erroneous. They are diffusion vacuoles. If the diffusion of stain into leucocytes is accelerated by heat or alkali so as to cause maximum staining without actually killing the cells, then stained liquid also passes into the colloid cytoplasm and remains suspended in it as a "red spot." A description of the nature of these spots was published in the *Journal of Physiology*, September, 1908. These vacuoles get gradually larger, and when the leucocytes die the spots suddenly disperse owing to the liquefaction of the cytoplasm. The suggestion of R. Ross, Moore, and Walker that if the spots could be seen in the blood platelets it would be proof of their cellular nature, was evidently based on the assumption that the spots were centrosomes. Since they are not centrosomes, it may be said that their appearance in the blood platelets now falls into insignificance. But the spots in the platelets also get larger and then disperse after an interval, and their disappearance is practically coincident with the disappearance of the vacuoles in the leucocytes, which is caused by the liquefaction of the cytoplasm occurring at death. Morphia also causes extreme vacuolation of the leucocytes. As a matter of fact, studying the question from another aspect also shows that their vacuolation is proof that the blood platelets are cells. When fresh blood is placed on the jelly and no morphia is employed the leucocytes do not become extremely vacuolated, nor do the platelets develop the spots. Why should morphia have this effect?

It was shown in a former paper[2] that different cells have different coefficients of diffusion, and that in blood cells approaching death causes a lowered coefficient. It is obvious that the vacuoles will appear more readily—that is, liquid will diffuse more readily into cells which have a lowered coefficient of diffusion. It is apparent, therefore, that the blood platelets must be cells, or rather must be composed of living protoplasm, for their vacuolation is produced experimentally by the action of the poison, as morphia, in causing the gradual approach of death, also lowers the coefficient of diffusion. Morphia lowers the coefficient more than any substance that has been tried as yet, and it appears to have a greater effect on the cytoplasm than other poisons. As all the platelets in a specimen usually become vacuolated, I believe that they all belong to one class of cell, derived from one source. In view of the vacuolation, the precipitate theory of the blood [illegible] theory, that they are [illegible] also, I think, be dis[illegible] that the nucleus of a cell is its "higher centre." It is difficult to believe that a cell can thrust out its nucleus. Moreover, in the paper in the *Journal of Physiology*, already referred to, it was stated [illegible] re never seen to be connected [illegible] ets, therefore, can hardly be [illegible] I believe, the outcome of the examination of dead structures. Blood platelets are never seen emerging from red cells when *in vitro* methods are employed. [illegible] platelets are fragments [illegible] which have the same staining rate as those of the leucocytes. When blood is placed on jelly which excites amœboid movement in leucocytes[3] the platelets have been seen to extrude and retract pseudopodia. On a few occasions a pseudopodium has been seen to become separated, and the fragment appears to be identical with the other platelets seen in the specimen. It may contain clear cytoplasm, a few granules, or even a lobe of the nucleus.

Clinical Notes:
MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

NOTE OF A CASE OF HYDROA GESTATIONIS.

By NINIAN M. FALKINER, M.D. DUB.

DR. E. Ward's interesting account of a case of hydroa gestationis published in THE LANCET of June 26th, p. 1827, reminds me that about 15 years ago I showed a case of this condition at a meeting of the Royal Academy of Medicine in Ireland. I did not make any permanent record of the particulars, but by good fortune I met the patient in a street in Dublin on July 17th of the present year and obtained from her the following details of her symptoms. She has been twice married. By the first husband she had three children—one boy and two girls—and during these pregnancies she had no eruption. By the second husband she had five children—four boys and one girl; she had the eruption each of the four times that she was pregnant with a boy but not during the second of the five pregnancies, the child being on that occasion the girl. On receiving this information I remembered having already heard from her that the eruption only occurred when she was bearing male children. She tells me that she has of late been under treatment for disease of the kidneys. She was always a pale, delicate-looking woman and in poor circumstances.

Dublin.

A CASE OF SYPHILIS WITH AN UNUSUALLY LONG INCUBATION PERIOD.

By G. PROSSER JAMES, L.R.C.P. LOND.,
M.R.C.S.ENG., D.P.H.

THE importance of an accurate knowledge of the incubation period in infectious diseases prompts me to record a case with an unusually long period.

A man consulted me on August 4th, 1908, with symptoms of commencing orchitis. He had exposed himself to contagion on July 5th, and seven days afterwards symptoms of gonorrhœa appeared, for which he treated himself (the treatment consisting, among other things, of a sulphate of zinc injection) for the seven days preceding the attack of orchitis. This attack of orchitis turned out to be a severe one and lasted nearly three weeks, after which I sent him away for a holiday. He returned on Sept. 12th with the history that on the 10th—i.e., 67 days after coitus—a small papule appeared near the frenum and had become perceptibly larger. I told him I was afraid it was a hard chancre, but did not put him on mercury immediately as the time since exposure seemed so unusually long. However, as time went on the papule became a typically indurated button, and on Sept. 29th (86 days after contact) a roseolar rash appeared, followed a day or two later by small tonsillar ulcers. The diagnosis being now beyond question I placed him on hydrargyrum cum creta (2 grains) every four hours. The rash speedily disappeared and the case is now running the usual course.

---

[2] Proceedings of the Royal Society, B, vol. lxxxi., 1909.

[3] THE LANCET, Jan. 16th, 1909, p 154.

Referring to the only authorities I have, I find that Hutchinson[1] gives five weeks as the common average and 55 days as the longest time he knows, and in this case the chancres were indurated on discovery, and so had probably been present for some days. D'Arcy Power[2] gives 25 days as the average, but tells his patients not to consider themselves safe until after the expiration of 40 days from date of exposure.

The patient's account may be taken as trustworthy.

Penarth.

A CASE OF FOREIGN BODY IN THE NOSE FOR 44 YEARS.

By D. Lindley Sewell, M.B., B.S. Lond., M.R.C.S. Eng., &c.,

HONORARY ASSISTANT SURGEON TO THE MANCHESTER EAR HOSPITAL.

A woman, aged 47 years, consulted me about a fœtid discharge from the left nasal passage. It was of some four months' duration, usually clear, but stained with blood at times. On examination a black mass was seen surrounded by sero-purulent secretion on the floor of the nose at the junction of the nose and naso-pharynx; to the probe it was found to be of stony hardness. It was broken into two pieces and removed with polypus forceps. On breaking the rhinolith up a small incomplete metal ring was found embedded in its midst. The patient then told me that when she was three years old a shoe-button had been lost in her nose and had not been recovered at the time, and so she was thought to have swallowed it. It is evident, however, that the button had formed the nucleus for the rhinolith and had remained in the nose for 44 years without giving rise to any symptoms.

Manchester.

Reviews and Notices of Books.

Symptoms and their Interpretation. By James Mackenzie, M.D. Edin., M.R.C.P. Lond., Physician to the West End Hospital for Nervous Diseases, London, &c. London: Shaw and Sons. 1909. Pp. 297.

In the introduction to this book the author points out that diseases in their earliest stages come before the general practitioner rather than the specialist, and that it is most desirable for the former to record his observations. Good work "can be accomplished by simple practical methods" without any of the "recondite methods used in well-equipped hospital wards or laboratories." If the book before us is to be considered an example of such work, we cordially echo the author's invitation to the general practitioner, for we find here an account of careful observations, well worthy of record, and leading to suggestive inductions which may benefit others confronted with the same clinical problems. Dr. Mackenzie divides symptoms into reflex phenomena, disturbances of function, and signs of structural defect. The last two are but lightly touched upon, the main subject of his work being a study of pain arising from disease of the different viscera. He accepts Lennander's views as to the insensibility of the stomach and intestines to painful stimuli, such as cutting or burning, and infers that the pain arising from visceral disturbance is due to overflow of the stimulus, carried by the afferent nerves, into the spinal nerves or their origins in the cord. Visceral pain is thus always "referred." On this view the pain in connexion with each viscus must always be referred to the same spot on the surface of the body, though it may radiate over a narrower or wider area. It should also be mainly referred to the skin as the seat of most sensation. But, as a matter of fact, it is usually possible to distinguish between a deep and a superficial pain. Further, taking for example the colon, it is not uncommon for the pain of colic to travel gradually along the course of the large bowel, from the right iliac fossa to the epigastrium and thence down to the left iliac region and hypogastrium, as the peristaltic wave descends. If the pain were solely "referred," this should not be the case. It would rather seem that pain may be felt "in the colon" just as it is in the finger, but the stimulus needed to produce it is of a special kind—viz., spasm or stretching of the muscular wall. It is probably only by experience that we learn to "refer" the pain of a stimulus arising in the finger to its seat of origin; the pain is, objectively, a molecular disturbance in certain cells of the brain. In the case of the internal viscera, which we cannot touch and see, the reference of the pain to its origin is naturally less accurate. Dr. Mackenzie gives interesting cases illustrating the pain of angina pectoris, which he seeks to rob of some of its terrors. Other examples of valuable observations are on the special pain associated with renal colic and with gall-stones.

The book may be cordially commended to the perusal of all who are engaged in the study of disease and who appreciate the assistance afforded by exact observation in furthering our powers of diagnosis.

Foods: their Composition and Analysis. By Alexander Wynter Blyth, M.R.C.S. Eng., F.I.C., F.C.S., and Meredith Wynter Blyth, B.A. Cantab., B.Sc. Lond., F.I.C., F.C.S. Sixth edition, thoroughly revised, enlarged, and rewritten. London: Charles Griffin and Co., Limited. 1909. Pp. 619. Price 21*s.*

New editions of this well-known standard work come with a regularity which shows that it maintains a steady popularity. The writers are both experienced analysts and they hold appointments under the Sale of Food and Drugs Acts which make their acquaintance with the administration of these Acts of a really practical kind. The senior author, Mr. Alexander Wynter Blyth, is also a barrister-at-law, so that together they know exactly the kind of difficulties which public analysts daily encounter in regard to procedure in the courts and to analytical methods. The work, however, is not confined to a presentation of merely those analytical methods which directly concern the public analyst engaged upon the examination of foods for the purposes of the Acts. The detection of adulteration is its direct aim, but chapters have been added on the chemical and bacteriological analyses of potable water. This section, coupled with that on the analysis of potable spirits, perhaps gives greater proof than any other section of the book of the revision and enlargement which have produced the present edition.

The very valuable work of Dr. A. C. Houston, which is published regularly in the reports on the metropolitan water-supply, finds acknowledgment in all modern literature upon the subject, especially that part of it dealing with the practical bacteriological study of drinking waters. The authors accordingly refer to the trenchant observations which Dr. Houston has made in regard to such questions as the isolation of bacillus coli communis, the persistence of sewage organisms in deep soil, the micro-enemies of pathogenic organisms, and so forth. In regard to the chemical analysis of drinking waters very few changes appear to have been adopted in the application of analytical methods, but mention may be made of the mportance properly attached by the authors to the estimaion of the dissolved oxygen in water, since the quantity of hat gas in water is diminished by the activity of microorganisms. Hence attention is directed to the more recent methods for determining dissolved oxygen accurately, methods which can only be usefully applied to examinaions made on the spot. Winkler's modification of the now classic method of Wanklyn, which is known as the albuminoid ammonia process, is mentioned, persulphate of potassium being employed to oxidise protein substances into ammonia. The fact that by this method urea, uric, and hippuric acid yield much more ammonia than when alkaline permanganate is used strengthens the hands of the analyst and increases his power of discrimination as to the nature of he nitrogenous substance present.

---

[1] Syphilis, 1893.

[2] Encyclopædia Medica: Article on Syphilis.

The question of the relative value of the chemical and bacteriological examination of potable waters receives little attention, the authors being content with merely observing hat "it is now generally admitted that no hard-and-fast tandards can be fixed for drinking waters either from a hemical or bacterial standpoint." "Every water," they dd, "should be judged with a full knowledge as to the urroundings of the supply and the geological formation rom which it is drawn." The section on the analysis of potable spirits has been expanded on account, no doubt, of he publicity recently given to the subject by police proceedings and a Royal Commission. The methods described are, for the most part, taken from the contributions of French and German authors. The paragraph on p. 397 on he ester iodine method shows careless editing, for "nitrate" hould be written "nitrite" and the reagent "sodium hydrogen" is new to us.

The book is one which medical officers of health, analysts, and others will still do well, as they have done in the past, o keep by them as a trustworthy guide and as a work of reference on matters pertaining directly to the analysis of foods.

Medizinal-Berichte uber die Deutschen Schutzgebiete fur das Jahr 1906-7. (Medical Reports on the German Protectorates for the year 1906-7.) Published for the Imperial Colonial Office by Ernst Siegfried Mittler and Son, Berlin. 1908. Pp. 324. Price M. 7½.

IN this volume are comprised a number of interesting reports on the health and sanitary condition of the Protectorates of German East Africa, the Cameroons, Togo, German South-West Africa, German New Guinea, the Caroline and Marshall Islands, and Samoa, for the official year beginning April 1st, 1906, and ending March 31st, 1907. Under separate headings are given the incidence of disease on Europeans and natives in each colony, the details being summed up in convenient tables, as also the cases treated in the hospitals or in the "policlinics" Some attention is given to certain diseases, more especially those which commonly occur in the tropics. In German East Africa, which has a total population of 4,785,204, of whom only 2142 are Europeans, there were medically treated during the official year 24,063 patients; 2250 of them suffered from malarial fever and 15 died, while 71 had blackwater fever, of whom 11 died. Of the 2250 malarial fever cases 706 were Europeans, of whom five died, and of the 71 blackwater fever patients 41 were Europeans, seven of whom succumbed to the disease. The measures employed in German East Africa against malaria included prophylaxis by quinine, destruction of mosquito larvæ, and the treatment of the surface of pools, puddles, and collections of stagnant water by petroleum. Sleeping sickness was introduced into German East Africa from the Congo State in 1901 but has never become widely prevalent, its manifestations being confined to certain definite localities which coincide with the distribution of the glossina palpalis. As a precautionary measure and with a view to seek out unrecognised cases the medical staff examined 11,511 persons in whom enlarged cervical glands were present, and of these 88 were found to be suffering from trypanosomiasis. There were no epidemics of small-pox in German East Africa during the year under consideration, only a few scattered cases being reported. Vaccination is compulsory; but no compulsion is required since the natives willingly avail themselves of this protection against small-pox. Calf lymph is used, and during the 12 months 33,540 vaccinations were performed, including 1265 revaccinations. The medical staff of the East African Protectorate includes 35 officers and 55 subordinates. Among other duties falling to the medical staff stationed at Tanga is the weekly inspection of prostitutes. Any woman found suffering from venereal disease is removed to hospital and detained there until her cure is complete. In the colony of Togo venereal diseases are stated to be extremely rife, both among the Europeans and the natives. For example, in one town where there are 132 resident Europeans no fewer than 124 of them have been under treatment for venereal disease. Gonorrhœa is especially prevalent among the semi-civilised coloured population and in the town already referred to we are told that it would be extremely difficult to find a black shop assistant who was not suffering from acute or chronic gonorrhœa. Such an individual, wittily remarks Dr. Kruger, the government surgeon, would be "ein weisser Rabe"—i.e., a *rara avis*.

In German South-West Africa, where during part of the year military operations were being carried out with a force of 15,000 troops against the Hereros and others, a large medical staff was employed, including 120 military surgeons and five other medical officers, 470 male subordinates, 43 Red Cross nurses, and 11 Sisters of Mercy. At the end of the year, the military operations having been concluded, the troops were reduced to 7000, with corresponding reduction of the medical staff. Malarial fever, dysentery, and enteric fever were very prevalent during the year, 57 Europeans dying from the latter disease alone. There was a good deal of sickness and privation among the native prisoners of war; for example, out of 2000 unfortunate blacks imprisoned by the Germans on the island of Haifisch no fewer than 1200 died, 70 per cent. of these deaths, it is stated, being caused by scurvy. Included in the volume are two special reports on the health of the troops in German East Africa and in the Cameroons. Appended also is a list of the titles of 67 works on tropical medicine and veterinary hygiene written by members of the staff in the various German protectorates, and published with the permission of the Imperial Colonial Office. For those acquainted with the German language there is a large amount of valuable and interesting information to be found in this annual volume of the *Medizinal-Berichte* for 1906–07.

The Edinburgh Stereoscopic Atlas of Obstetrics. Edited by G. F. BARBOUR SIMPSON, M.D. Edin., F.R.C.P. Edin., F.R.C.S. Edin., and EDWARD BURNET, M.B., Ch.B. Edin. In Four Sections, each containing 25 subjects with descriptive text. Sections 3 and 4. London: The Caxton Publishing Company. 1908 and 1909. Price 4 guineas *complete.*

THIS work has now been completed by the appearance of the third and fourth sections. The third section illustrates the anatomy of the fœtal skull, the mechanism of the second and of the third stage of normal labour, the post-partum uterus, and the application of axis-traction forceps. The photographs are, of course, actual reproductions after nature We understand many of the difficulties that have to be contended with and are not wholly surprised to find that a good many of the illustrations do not show very much. The statement that the passage of the placenta into the vagina may be detected by the hardening and diminution in size of the uterus is certainly not accurate. When we consider how large a part has been played by the Edinburgh School in the elucidation of the correct mechanism of labour it is surprising to find that the two separate and distinct movements of restitution and external rotation are confused. They are certainly not the same thing and should be separately described. The series of illustrations of the application of the forceps is a good one, and we are glad to see that axis-traction forceps alone are figured.

The fourth section deals with breech and face presentations, Cæsarean section, ante-partum hæmorrhage, extra-uterine gestation, hydatidiform mole, hydrocephalus, and inversion of the uterus. The representation of the varieties of transverse presentations does not appear to be very satisfactory. In a work intended for the guidance of the student we wish that the operators who are taking part in the performance of Cæsarean section might have had their arms covered up, and a little more orderly arrangement of the surrounding towels and other paraphernalia would have made a better impression, and certainly a better photograph. It is a pity that the uterus with a hydatid (*sic*) mole *in situ* is not very well arranged for reproduction, as the specimen is one of much interest. If due allowance is made for their necessary limitations these photographs should prove of considerable advantage to the student in enabling him to refresh his memory and to recall to his mind what he has actually seen at the bedside. We are sure they will thus prove useful to a large number of students and practitioners.

LIBRARY TABLE.

Practical Integration for the use of Engineers, &c. By A. S. PERCIVAL, M.A. Trinity College, Cambridge, Author of "Optics" and "Notes on Optics." Second edition. London: Macmillan and Co., Limited. 1909. Pp. 114. Price 2*s* 6*d*. net.—The most important mathematical aid to the modern advancement of physical science has been afforded by the calculus, and this not only in the theoretical part of modern science but also to at least an equal extent in the practical application of science. In electricity and in engineering a knowledge of the integral calculus is essential for all who would be guided in their work by more than the thumb rules derived from practical experience. It is essential, however, that any treatise intended for those who have to deal with problems needing the integral calculus should present the subject divested of all unnecessary appendages and in the simplest and most practical form, if the information is readily to take the place of the lessons of experience, and here we consider that Mr. Percival has been very successful. He has drawn up a book on integration which is really adapted to practical use. For the information of those who have no knowledge we give the following examples from Mr. Percival's book of what integration can accomplish. By integration we are enabled to find the course of a projectile which is subjected both to the influence of gravity and to the retardation of the air; to find the tension in a chain suspended at both ends as in a suspension bridge; to find the volumes or the surfaces of bodies of any regular form; and to determine the rate of cooling of a heated body. Many of these problems are soluble for particular cases without the use of the calculus, but to obtain general formulæ and to solve individual problems with rapidity the integral calculus is a necessity. This little work can be recommended to the attention of all advanced students in applied physical science.

The Therapeutics of Radiant Light and Heat and Convective Heat. By WILLIAM BENHAM SNOW, M.D., late Instructor in Electro-Therapeutics in the New York Post-Graduate School. London: Siegle, Hill, and Co. 1909. Pp. 119. Price 10*s*. 6*d*. net.—Considering the cardinal importance of heat as a therapeutic measure, the first idea that presented itself to us when we took up this book was to wonder why so little has been done hitherto in the way of bringing out a systematic treatise on heat in its different forms for the treatment of disease. We have large and small books published from time to time on the use of other physical agents, such as the X rays and electricity, but few, if any, on the subject of heat, which is perhaps as important as any. On this account we welcome this book, in which the author has endeavoured to add to our knowledge of the matter. The physical side is dealt with in a chapter that is commendably brief, and the same may be said of the manner in which certain forms of apparatus are described. Chapters on physiological effects and practical methods of application next follow, and as early as p. 49 the purely therapeutic aspect is treated. In this section we notice that seldom, if ever, does the author advise the use of heat alone in the treatment of any of the conditions referred to. Static current, X rays, and high-frequency currents are given an importance equal to, and at times exceeding, that of light and heat, so that it becomes well-nigh impossible to judge with any approach to accuracy as to how far the result is due to one or other of the several agents employed. Further, it must be admitted that at times the statements made are not scientifically accurate. For instance, the following paragraph occurs on p. 54: "It is the writer's practice in the treatment of infectious conditions to make a prolonged—20 to 30 minutes—exposure to the Roentgen ray, making use of the energy usually employed in the treatment of skin diseases for the purpose of inhibiting the activity of the germs and then permitting an interval of 12 to 18 hours before the administration of the radiant light and heat, or high-frequency current or both. The germs thus brought into a state of complete inhibition, increased by the delay, are so affected that the phagocytes brought fresh into the area, and in large numbers, with the hyperæmia induced by the radiant energy, devour them with a greater certainty. By this method it is possible to abort any accessible pus process prior to fluctuation." Again, in speaking of the treatment of chronic varicose ulcers, where he seems to have had much success, the author says: "No agent known to the writer is so energetic in removing the local induration and tissue infiltration as the static brush applied daily, following a prolonged application of radiant light and heat." We do not want, however, to spoil our appreciation of the book as a whole by labouring small points; we hope that the work is the forerunner of others dealing with this most important subject in a more comprehensive manner.

Le Lupus Érythémateux Aigu d'Emblée: Étude Clinique. (Primary Acute Lupus Erythematosus: a Clinical Study.) Par le Docteur GEORGE PERNET, de la Faculté de Médecine de Paris, &c. Paris: Jules Rousset. 1908. Pp. 135. Price 5 francs.—Lupus erythematosus is a persistent, disfiguring condition of doubtful etiology, but productive of little harm to the general health of the patient. Instances, however, do occur, though rarely, in which a case starting as an ordinary erythematous lupus rapidly develops into a widespread eczematous affection of the skin, which would not have been considered as belonging to this group if the earlier manifestations had not been recognised. Still rarer are those cases in which a general involvement of the skin occurs similar in nature but independently of any previous typical lupus erythematosus. These are the cases which Dr. Pernet has studied in this monograph. They are extremely rare, for he has been able to collect only nine examples from the whole of dermatological literature, and to these he has added one which he had observed at University College Hospital, London. The most remarkable fact about these cases is the very heavy mortality, for of the ten cases recorded here nine died. We agree with Dr. Pernet that the whole condition points to an acute intoxication, but the source of this is not evident. As to treatment, it may be mentioned that the only case which did not end fatally improved while she was taking large doses of quinine, and this drug deserves a thorough trial in any further case presenting itself. The book is a very thorough study of a rare and obscure group of cases, and we regard it as a valuable addition to dermatology.

JOURNALS AND MAGAZINES.

Edinburgh Medical Journal.—In a Promotion Address published in the August issue of this journal Sir Thomas R. Fraser notes the greater attention now paid to original research at our universities, and at the same time demands more facilities for the teaching of special subjects, such as ophthalmology, insanity, and so forth. Dr. N. T. Brewis writes on retroversion of the uterus, and details his method of performing the operation of shortening the round ligaments for the cure of this condition, a number of diagrams being given illustrative of the steps in the procedure. Mr. James Young discusses the anatomy and histology of the pregnant tube; this paper is also well illustrated. Dr. R. Cranston Low, in a note on the cutaneous tuberculin reaction in cases of disease of the skin, holds that, while a positive result does not prove a particular lesion to be tuberculous, a negative result is of value as excluding this infection.

The Medical Chronicle.—The first instalment of a dissertation, by Dr. Elsie M. Royle, on the composition of the urine in cases of malignant disease and the light it may throw on theories of tumour formation, appears in the August number of this magazine. The conclusions reached in the cases studied were that the total nitrogen is below normal, as is the excretion of chlorides. Uric acid appears in normal quantity, but the excretion of sodium salts is subnormal. The other constituents vary considerably in different cases. Dr. E. M. Brockbank records some post-mortem notes on syphilitic lesions, and shows that in about 60 per cent. of the cases in which such lesions were found no clinical history of the disease had been obtainable.

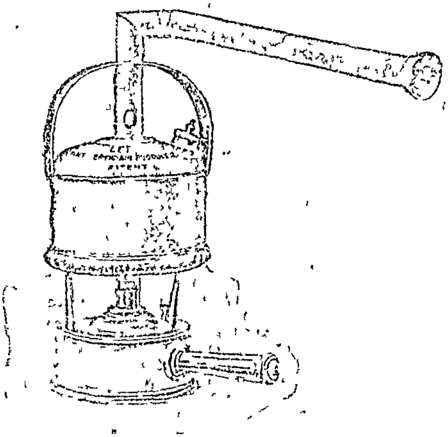
Birmingham Medical Review.—In the May number Dr. David Fraser Harris's lectures on the Essentials of Physiological History are continued, this second lecture dealing with the work of Harvey and with that of subsequent discoverers in the field of hæmatology. Dr. Herbert Manley discusses the medical aspect of the report of the Royal Commission on Poor-law reform and expresses his appreciation, in some respects, of the Minority Report; and Dr. Leonard G. J. Mackey contributes an abstract of some remarks on the commoner methods of research in clinical pathology, such as the examination of cerebro-spinal fluid, the Widal test, and so forth.

SOUTH-WESTERN POOR-LAW CONFERENCE.—The annual Poor-law Conference for the south-western district, comprising the counties of Cornwall, Devon, Dorset, Somerset, and Wilts, will be held at the Council Chambers, Salisbury, on Oct 12th and 13th, under the presidency of Sir T. Dyk [illegible] will be "T [illegible] on which [illegible] invited speaker being Dr. [illegible] inspector of the Local [illegible] purposes.

New Inventions.

LEE'S ANTISEPTIC AIR PRODUCER.

IT must be admitted that so far the apparatus employed for the treatment of respiratory disease by methods of inhalation have shown little, generally speaking, by way of scientific precision. The kettle or jug of hot water with a spoonful or two of tinct. benzoin co. added afforded a rough and ready way of obtaining hot wet vapours redolent with the aromatic and soothing resin, but the method could lay no claim to any degree of standardisation, and in many ways was inconvenient. And yet the administration of antiseptics and soothing agents by inhalation is a common demand in medical practice. An apparatus, therefore, which is designed to produce a continuous current of air made moist with steam and antiseptic with such agents as carbolic acid, guaiacol, eucalyptus, and so forth, will be very generally appreciated by the practitioner. Mr. Lee's antiseptic air producer is the best apparatus we have seen for the treatment of respiratory disease by inhalation [illegible] in fact, a successful effort to place the [illegible] As the accompanying illustration [illegible] of simple construction. It con[illegible]ner, a boiler, and an exit tube which serves the purpose of a steam injector. The injector, which takes the place of the ordinary spout of a kettle, is the principal and most important feature of the apparatus. Its construction and action are best explained by comparing it with the action of the ordinary Bunsen atmospheric burner. Steam at a slight pressure, controlled by a safety valve, escapes th[illegible] projected along the spout. [illegible] pressure steam draws in [illegible] the inlets shown on the t[illegible] result is that a current of warm moist air with an output of from 200 to 300 feet per minute is projected into the room The analogy of the Bunsen burner will now be recognised. If the water in the boiler contained 1 per cent. of phenol the steam escaping on boiling would contain the phenol in th[illegible] afterwards, of course, the mixture i[illegible] long as the water-supply [illegible] long therefore is a current of warm, moist, antiseptic air [illegible] effects the warming, [illegible] with an anti[illegible] tient suffering from any form of respiratory disease. It should be added that the spout can be turned in either a vertical or horizontal [illegible] moist, [illegible] the [illegible] dit-



THE SIXTEENTH INTERNATIONAL MEDICAL CONGRESS, BUDAPEST, AUGUST 29TH TO SEPT. 4TH.

THE Sixteenth International Medical Congress held its formal opening meeting on Sunday, August 29th, at 11 A.M., in the banqueting hall of the Municipal Festival Hall.

We append an account of the proceedings at the opening, and a note upon the important conference of the International Medical Press which immediately preceded.

(FROM OUR SPECIAL SANITARY COMMISSIONER.)

The International Association of the Medical Press and Congress Reform.

Budapest, Sunday, August 29th, 1909.

The meeting of the International Association of the Medical Press, which sat for the two days preceding the Medical Congress, attracted to Budapest a sort of advance guard of the Congress. As early as Wednesday there were already present members of the Congress which was not to open until the following Sunday. The Congress badge made its first appearance in the streets of the capital braving the surprised stare of the citizens who wondered who these strangers might be wearing an unknown device or decoration. Now that thousands of such badges are to be seen in the streets the novelty has already worn off, and yet the Congress has not begun its work. But the Medical Press conference has terminated its task, and this includes what should prove of considerable help to the central organisation of the International Medical Congress and to all future gatherings. The representatives of the Medical Press discussed at length and voted the adoption of the recommendations presented by the British section suggesting how a permanent commission and permanent organising general secretary might be constituted to manage these gatherings in the future.[1] On Thursday and Friday next week the Central Organisation, consisting of the principal officers of the Congress and the presidents and the secretaries of the various national committees, will be held. This body, the parliament of these Congresses, will not only decide where the next Congress is to meet, but whether it is to be held at a later date than usual and be differently organised. This is a matter on which there is much to say. For the moment it suffices to point out that the necessity of sweeping reforms has been unanimously proclaimed by the representatives of the International Association of the Medical Press in congress assembled.

Preliminary Festival and Improved Organisation.

Yesterday (Saturday) was the great day of arrivals, and when the members of the Medical Press Congress, having terminated their work, returned hot and weary to their hotels they found pandemonium awaiting them. Train-loads full of congressists were arriving, dusty, hot, weary, but, above all, thirsty. With the best organisation possible, when so many persons clamour at one and the same time, whether for the same or different things, they cannot all be immediately served. And the hurry was all the greater, as there was to be a reception that evening at the Fine Arts Gallery in the City Park. This brought back to my mind sinister recollections of the International Congress of Hygiene when it met at Budapest in 1894. Here a reception had been given and a lot of young men, who ought not to have been invited or admitted, behaved like savages at the buffet. This caused such a scandal that even a Hungarian paper published two pictures, one representing the siege of the buffet by these youths, and the other a feast of monkeys in a forest. It was good that the well-deserved gibe should have come from the Hungarians themselves. It is a pleasure to say that nothing similar occurred last night. We had better-behaved company and much better management. In addition to the large buffet there were many tables spread with refreshments in different rooms, while a number of waiters went the round of us with trays heavily loaded with cakes, ices, fruits, and glasses of champagne. There was therefore no necessity to crowd up to the buffet, and it was found possible to provide amply and without disorder for a large crowd. But it was not possible to prevent the heat, which, due partly to the overcrowding, was so appalling that some persons fainted and one man was carried out unconscious from my immediate neighbourhood. The number of persons who attend congresses must somehow or other be reduced if their work is to count in the world. I must allow myself one grumble. The cloak-room department was badly managed. The annexes were not large enough nor were there sufficient attendants. Consequently the guests could not get their clothes back quickly enough and at last lost patience, forced the barriers, and endeavoured to find their things for themselves. Of course, what little order remained was soon destroyed, cloaks and hats were tossed about and trampled upon, and there was a regrettable interchange of property. One of the delegates of the Belgian Government had the good fortune to recognise his coat, though it fitted very nicely on another person's back. Indeed, the fit was so perfect that the wearer stoutly maintained it was his own coat, for he had not noticed the small tell-tale Belgium decoration in the button-hole. A further reference to the tailor's name and Belgian address marked behind the collar fully established the right of ownership, and the coat was restored. But the hat which was with the coat had been taken by someone else and could not be found, so the representative of the Belgian Government had to return bareheaded to his hotel, well pleased, however, at his good fortune in recovering his coat. For my part, foreseeing what was likely to happen, I clung tight to my coat and hat all the time, but this increased my suffering from the heat.

The Opening Ceremony.

An hour before the opening ceremony, which was fixed for 11 in the morning, a crowd had already assembled in the streets to see the members of the Congress enter the great Municipal Festival Hall where the ceremonial opening of the Congress was to take place. It is the same hall which was utilised for the Congress of Hygiene in 1894, but it seems to me that it was then even more crowded than to-day. On both occasions, however, there was not even standing room left long before the proceedings began. The meeting was certainly an imposing sight. Though broad daylight, the hall was fully illuminated, which made the marble walls and columns, the gilt ornamentation and the gold or silver braiding of the uniforms shine more brilliantly. When His Imperial and Royal Highness the Archduke Joseph stepped on to the platform the whole audience rose. At the same moment a powerful choir sang vigorously the Hungarian Anthem. Instantaneous silence succeeding the loud buzz of conversation, and the slow and solemn strains of the hymn produced a thrilling effect. If the rest of the ceremony hardly gave so impressive a sensation as its opening this could not be expected. Moreover, the hall is some 40 to 50 feet high, surrounded by galleries, and as the acoustics are shocking only those who were quite near to the platform could hear the loudest speakers. And as speakers are appointed on account of their position, and not in consideration of their powers of speech, a good deal of what was said had to be taken on trust.

The Archduke JOSEPH spoke in French and welcomed the congressists to the Hungarian capital with the following words: "It is with special satisfaction that I have the honour of opening, in my capacity of Representative of his Apostolic, Imperial and Royal Majesty, the Sixteenth International Congress of Medicine at Budapest. To be at the service of humanity, to consecrate all the physical forces and intellectual faculties which God has given to the welfare of our fellow beings, remains the ideal existence. Now the individual value of each man's work is augmented in proportion as it becomes more profitable to other individuals and to humanity as a whole. And what is true for any individual is still more true for an entire profession, and in this respect all men who have a just perception must recognise that there are few professions which exercise on the individual, on the family, and, as a final consequence, on the entire life of States, an influence as profound and as widespread as that exercised by medicine. Happiness, to which every living being has a right, is dependent on vigorous health, and so is the success of nations. When by efforts you seek to preserve the health of entire populations we must show you not only individual but general gratitude, the gratitude of all mankind."

The next speaker was His Excellency Count ALBERT APPONYI, the eloquent Hungarian Minister of Public Education and Public Worship. He expressed the satisfaction of his Government at being able to receive in Budapest the [illegible] As a working [illegible] d by the ever-[illegible] ession exercised over the destinies of the peoples. Formerly the nation which fought best was the most highly esteemed. To-day intellectual and moral development and social well-being held the first rank. Nations were judged according to their progress in public hygiene. Health was more and more estimated as the evidence of a nation's strength. Such congresses showed that nations would now compete not in destroying but in saving life—an infinitely more reasonable as well as more humane programme.

---

[1] THE LANCET, August 21st, p. 554.

The Prefect of Budapest, M. CALMAN DE FÜLEPP, then welcomed the Congress in the name of the city. Gatherings held to promote progress by preserving the greatest of all treasures—health—were of the first importance, and he welcomed especially the numerous ladies in the assembly, who were helping [illegible] their work.

The President [illegible] MULLER, was unfortunately so [illegible] t attend. His inaugural address, however, was read out by an officer of the Congress and proved to be an eloquent exposition of the developments of recent medicine. Firm ground in pathological anatomy having been reached, the developments of bacteriology and parasitology followed, to be reinforced in their turn by the immense masses of work being done in the investigation of the problems of immunity. Cytology has developed, he said, *pari passu*, and everywhere vague inquiry has been replaced by investigation into the life of the cell, making us more acquainted with its complicated bio-chemical and bio-mechanical relations—and so we have a new hæmatology. The latest discoveries in physics and theories as to radio-activity have all been pressed into the service of medicine, not as auxiliary sciences but as integral parts of a great whole, while at every step forward a new perspective opens and a view of fresh fields is offered. After enumerating proofs of the scientific progress which has been made upon indisputable grounds by modern therapy, Dr. Muller closed his address with the following peroration: "Medicine is a science of expediency; it originated the necessity to relieve human suffering, and as pure rough empiricism. To-day we work upon the strictest scientific methods which are at the disposal of the exact physical sciences, and we have successes to point to, to which undeniable statistics bear witness, showing with what weapons medicine can safeguard the life and health of the individual, and how fortified she is to protect whole continents against the ravages of epidemics. With full right our breasts are filled with the noble consciousness that no science stands up so wholly in the service of altruism as medicine. With deep respect I have the honour to request your Imperial and Royal Highness graciously to declare this Congress *open*."

The report of the general secretary, M. Em. de Grósz, was now taken. From this it appeared that the national committees which abroad assisted in preparing for the Congress comprised in all no less than 800 members. With their help the Congress is thoroughly international. The latest figures are: United States, 202; Argentine Republic, 37; Austria, 235; Belgium, 47; Bosnia-Herzegovina, 9; Brazil, 25; Bulgaria, 18; Chili, 4; Cuba, 6; Denmark, 10; Egypt, 21; France, 281; Germany, 288; Great Britain and colonies, 97; Greece, 19; Italy, 170; Japan, 48; Mexico, 3; Monaco, 2; Norway, 2; Netherlands, 33; Portugal, 32; Roumania, 10; Russia, 228; Servia, 7; Spain, 67; Sweden, 5; Switzerland, 29; Turkey, 22; and Uruguay, 3. Adding the 1436 Hungarian members the Congress numbers 3432 adherents, accompanied by 900 members of their families. Governments are represented by 274, universities by 149, municipal and other authorities by 149, medical and other societies by 327, and diverse institutions by seven delegates to our scientific assembly. Recalling the words of Pasteur that "the realm of science embraces the whole of humanity," M. de Grósz congratulated the Congress on its international character.

After this the series of speeches of the representatives of the various nationalities began and continued according to the French language; therefore Germany—i.e., Allemagne—began in the person of Professor Uhthoff. A crowd thronged at the foot of the platform and not a word reached the press tables. Austria, which came next, was represented by Ritter von Huberler, whose speech was also a mere dumb show. Dr. Victor Desguin for Belgium was not more fortunate, but Dr. Ivanoff for Bulgaria evoked quite loud applause, because the few words he said expressing the satisfaction of his country in supporting the Congress were better heard. Professor Alejandro del Rio from Chili and Professor Agramonte from Cuba were again inaudible, and a ribald member of the audience near me said that most of the speakers must be "delegates from Mars speaking in Esperanto." Professor Salamonsen represented Denmark and Professor A. de Simonena spoke for Spain. For France Professor Landouzy, who is such an accomplished orator, was not heard so well as usual, but a good many of his graceful sentences were caught by his audience, showing that the oratorical failures were not attributable entirely to the properties of the hall. Amidst great applause he expressed the hope that the proceedings of the Sixteenth International Congress of Medicine would bring a new triumph for Budapest, and would do for the greater happiness of humanity what the Eighth International Congress of Hygiene, also held at Budapest, did when [illegible] world the results obtained [illegible] serum. For Great Britain [illegible] t loud applause, but after this the audience, overwhelmed with the heat and worried by the impossibility of hearing most of the speakers, began to leave the hall. Professor Killionzis spoke for Greece, and loud applause greeted the announcement that Professor G Baccelli would represent Italy. Alas! he was not audible at the press tables, and upon this the press representatives drew up a protest, which all signed, declaring that they were so placed as to be utterly unable to report the proceedings adequately. Professor Kitasato of Japan was loudly cheered. Dr. Guevedo y Zubieta for Mexico and Dr. Caillard for Monaco were followed by Professor Louis H. Debayle for Nicaragua and Professor V. C. Uchermann for the Netherlands. Dr. José Domywer de Olivier for Portugal expressed our feelings very well by constantly wiping his forehead with his handkerchief, and Professor de Ott, though he spoke for so large a country as Russia, made very small noise. Professor S. E. Henschen spoke for Sweden and Dr. Feurer for Switzerland, and then came the great demonstration and the one really remarkable incident of the whole solemnity. Professor Zoëros Pacha was announced as the representative of Turkey. The professor is certainly not a young man, and I remember his representing Turkey at other congresses during the darker days of Turkish history. Nevertheless, the meeting evidently took him as the spokesman of the Young Turkey Party, and by the loudest and most enthusiastic applause that had yet been heard sought to welcome the dawn of liberty in Turkey. Undoubtedly this was a political demonstration, but science needs liberty and thus its representatives ever applaud that which gives the freedom to study. Uruguay, with Professor A. C. Maggiolo, closed the long [illegible] yet one more spe[illegible] the newly elected [illegible] ociation of the Medical Press. He rose on behalf of that body, but declared that he had no speech to make because the press has to write and not to speak. He had received instructions to thank the organisers of the Congress for the press bureau they had established, and for their better understanding of the importance of the press. If some new light came out of this Congress, as had occurred at the Hygiene Congress in 1894, the press would spread the good tidings rapidly and widely throughout the world.

After these words the National Hymn was sung again and the vast audience slowly dispersed.

THE GENERAL SESSIONS.

At the general sessions addresses will be delivered in plenary congress by Professor BACCELLI (Rome); Dr. E. F. [illegible] Cancer; Professor M. KUTNER (Berlin); [illegible] Pathologie Exotique; Pro-[illegible], Artificial Parthenogenesis [illegible] and Pathology of the Cell.

We publish this week (see p. 691) Dr. Bashford's address on Cancer, which was delivered on Monday, August 30th.

(FROM OUR SPECIAL MEDICAL CORRESPONDENT.)

The First Reception.—Congress Literature.

Budapest, August 29th, 1909.

THE first of the social entertainments in connexion with the Medical Congress was held on Saturday evening, August 28th. It took the form of a "Soirée of Welcome," held in the gallery of Fine Arts. This is a rather attractive building situated some little distance from the centre of the town, on the borders of the City Park. The arrangements were good, and there was not more crowding than is usual, and apparently inevitable, in connexion with such social functions. The crowd circulated freely along the central series of rooms, which terminate in a semicircular hall, and in this an excellent buffet was placed. The lateral series of rooms, through which it was also possible to circulate from one end of the building to the other, bore the numbers of the different sections of the Congress, and this certainly rendered somewhat easier the task of finding one's friends and acquaintances—an otherwise almost hopeless task in the general crowd that filled the central halls. These halls are at present, with one exception, entirely bare of pictures or other objects of the fine arts. The sole exception is the entrance hall, on either side of which is hung a large picture by the Hungarian artist J. Benczur. That on the left represents "The Hungarian Nation rendering Homage to the King—i.e., the Emperor-King Franz Josef—on the Occasion of the Millennium of Hungary"; it was presented to the Hungarian nation by the late Dr. Charles Meszaros. The picture on the right, "The Recapture of Buda," is the property of the municipality of Budapest. Both are fine examples of a clever artist, to whom evidently vivid colouring and no less vivid action make a specially strong appeal. The soirée lasted from 9 till 11 o'clock, but before the latter hour many had left. The night was a particularly close one and the air in the crowded rooms had inevitably become somewhat hot and exhausted before the evening was over. A good band, it should be added, discoursed an excellent musical programme throughout the entertainment.

Congress Literature.

Even before the opening of the Congress the literature in connexion with it was voluminous. Each "congressist" on presenting his "card of identity" at the central office received a small pamphlet containing a calendar of the Congress and a number of detachable coupons. In return for one of the latter, he (or she) received a large packet of printed matter, neatly strapped together. The packets could be sent to the member's hotel (or other address) on payment of 1.50 crowns. Each packet contained the following: "Les Facultés de Médecine des Universités Royales Hongroises de Budapest et de Kolosvár," a cloth-bound volume of nearly 400 pages, profusely illustrated, the contents of which may be gathered from the title; "L'Hygiène Publique en Hongrie," a small 8vo volume of over 300 pages, describing at great length what has been done and is being done for the public health in Hungary; "La Hongrie Charitable: l'Assistance Publique et les Hôpitaux en Hongrie," a rather thinner volume of the same size as the one on "Public Health"; a similar volume, but of 90 pages only, and printed in English (for English-speaking members), called "The Therapeutic Bath, St. Margaret's Island," in which that excellent bathing establishment is fully described and illustrated; an album of well-reproduced photographic views of "Budapest"; a copy of the August number of *La Revue de Hongrie*, the organ of the French Literary Society of Budapest; a pamphlet on the Budapest Voluntary Ambulance Society; another by Dr. Ohyzer (head of the Public Health Department of the Ministry of the Interior); a copy of the *Hungarian Balneological Review*; and a special Congress number of *Hungary*, an illustrated fortnightly society journal, printed entirely in English. Copies in the French, German, and English languages were distributed to the congressists. A little pocket guide and map of Budapest is among the most useful though one of the smallest of these publications. In other portions of the central building the congressist was presented with the Congress badge. This is a square bronze medallion with rounded top; it bears, on one side, the seated figure of Æsculapius, and the words "Conventus Medicorum XVI. Internationalis," and, on the other, a view of Budapest and the Danube, the united arms of Austria and Hungary, and the words "MCMIX. Budapestini." The badge is the design of one of Hungary's best-known sculptors, M. Géza Vastagh, and is a really admirable work of art. More than one of the many monuments in the squares and gardens of Budapest are from the chisel of this sculptor. For ordinary congressists the badge is hung by a white ribbon; in the case of delegates of Governments the ribbon is red; in that of members of national committees, delegates of universities, and municipal authorities it is green; while members of the central organisation of the Congress are distinguished by their badge hanging from a ribbon of red, white, and green—the Hungarian national colours.

Other objects presented to the member on his first visit to the Central Office were the first number of the daily *Journal* of the Congress and a good plan of the city of Budapest; and an "honorary ticket," entitling the bearer to free use, during the period of the Congress, of any of the four following bathing establishments: those on Margaret Island, the Rudasfürdö, Császárfürdö, and the Ráczfürdö baths.

The first number of the daily *Journal* of the Congress was issued on Saturday (August 28th). It is printed in parallel columns, in English and Magyar at one end; then you turn it upside down and find that the same matter appears in French and in German at the other end; the two (or rather the four) meeting in the middle, the whole number containing 24 pages, 12 from each end. The English columns are excellently edited in good idiomatic English, with none of those blemishes that frequently disfigure polyglot international literature of this kind.

Together with the *Journal*, in the form of six separate appendices, were distributed a series of plans of the different floors of the central building of the Congress; the printed regulations for the conduct of the sectional meetings in the same four languages as the journal; the full programme of all the sections, covering 34 pages of large size, printed in double columns; full lists of members of the central organisation of the Congress, of the sectional bureaux, and of the national committees (these lists cover 11 pages of the same size); lists of the delegates from governments, from universities, from municipalities and other authorities, from medical and scientific societies, and "various" delegates (an addition which covers over 15 pages); and finally an alphabetical list of all the members of the Congress, with (where possible) the name of their hotel or other address in Budapest.

THE SECTIONS.

SECTION I.—ANATOMY AND EMBRYOLOGY.

President, M. DE LENHOSSÉK.
Managing Secretary, M. K. DE TELLYESNICZKY.

Dr. E. LAGUESSE (Lille), in a paper on

The Islands of Langerhans of the Pancreas,

described his investigations made on the body of an adult man who had been executed. He laid particular stress upon the presence of a large amount of secretory material in the cells with the appearance of small closely packed vacuoles and also of little granules, and maintained that these appearances gave the islands all the characters of a gland with an internal secretion, or "endocrine," and strictly comparable with the appearances of the parathyroids. He proceeded to consider all the facts that seemed to substantiate his theory of Balance (between the internal and external secretions of the pancreas), as against the theory of the perpetual independence and stability of function of the islands of Langerhans, submitting that—1. In adults there is a demonstrable continuity between some of the islands and the acini, and more directly between the islands and the excretory ducts of the gland. 2. In certain places the mixture of the "exocrine" and "endocrine" gland elements is such as to suggest a transitory state. 3. There is to be found, on the one hand, a whole series of transition forms between the acinar and insular elements, and, on the other hand, an *inverse* series demonstrating the reconstruction of the acini from the islands. 4. An increase in the insular substance can be provoked *experimentally at the expense of the* "exocrine" parenchyma of the gland, and pathological processes can effect the same result. 5. Recently the theory of Balance in the pancreas (that is to say, the complete evolutionary cycle of the island of Langerhans with its return to the acinar form) has received experimental proof. In conclusion, there is an intimate connexion between the two glandular elements of the pancreas, and a continual balance maintained between them by their mutual metamorphosis during the whole of life.

SECTION II.—PHYSIOLOGY.

President, M. F. DE KLUG.
Managing Secretary, M. PEKÁR.

Dr. P. ALBERTONI and Dr. P. TULLIO (Bologna) presented a joint paper on

The Methods of Studying the Diet of the Various Classes of Society.

In support of the American plea of Dr. Atwater asking physiologists to adopt a [illegible] dietetic food-values of the [illegible] the methods they themsel[illegible] on. During the observa[illegible] families continue their [illegible] usual conditions. The dietetic factors are always considered in relation to the physical, moral, and economic conditions of the subjects of investigation. To determine the physiological value of any foodstuff the subjects are given their ordinary diet with the food in question added, and all the food used by them is submitted to a preliminary chemical analysis. It is important that the methods of analysis and of deduction employed by all physiologists investigating this problem should be the same.

SECTION III.—GENERAL AND EXPERIMENTAL PATHOLOGY.

President, M. F. TANGL.
Managing Secretary, M. P. HÁRI.

Dr. BESREDKA (Paris), in a note on

The Preventive Treatment of Anaphylaxis,

submitted the following points: (1) Anaphylactic sequelæ can be modified but not entirely prevented by the heating of therapeutic serums to 56° C. for an hour on four days running; (2) ether, or better, alcohol narcosis (however the latter be induced, by the mouth, or by hypodermic, peritoneal, or rectal injection), confers a complete but transitory immunity; (3) the prophylactic injection of serum that has been heated to 80° confers a sure and lasting immunity which is established by slow degrees after a slight reaction; (4) the best way to prevent anaphylactic complications consists in the prophylactic rectal injection of serum, or, better still, the injection of a very small dose of the same serum under the skin, to induce the formation of an anti-anaphylactic substance.

SECTION IV.—BACTERIOLOGY AND PATHOLOGICAL ANATOMY.

President, M. H. PREISZ.
Managing Secretary, M. E. KROMPECHER.

Professor N. PANE (Naples) read a paper on

The Nature of Antagonism in Bacteria and its Practical Importance.

Amongst the pathogenic microbes only the bacillus of anthrax can be destroyed in the system by the antagonistic action of several bacteria—streptococcus erysipelatis, staphylococcus pyogenes, bacillus pyocyaneus, pneumococcus, and bacillus prodigiosus—under special conditions. The most favourable of these conditions is the subcutaneous inoculation of anthrax mixed with one of the others in suitable doses. The particular state of virulence or non-virulence of the antagonists and the choice of the animals for experiment are of great importance. The antagonistic action of a bacillus may meet with complete success in [illegible] even when it fails, or is only partially s[illegible] land or when test[illegible] oratory. The substance or substances which act against the bacilli of anthrax in the organism belong partly to the antagonist and partly to the antibodies in the organism itself. As regards the nature of the antagonistic substances, confining ourselves to the bacillus pyocyaneus, which is the most energetic and the most certain in its action, it is to be observed that the broth culture of this bacillus, killed by exposure to a temperature of 55° C. for an hour, shows in the test-tube a bactericidal action at 35°–37° C. by [illegible] mixed with absolute ethyl alcohol a clearly demonstrable bactericidal substance is diffused into the alcohol, although it is readily separated from the alcohol by evaporation at 60° C. The practical application of the resistance of pyocyaneus to anthrax might be made in the vaccination of animals susceptible of spontaneous infection, since a considerable immunity can be conferred on animals under experiment by means of subcutaneous inoculation with the anthrax bacillus mixed with the soluble products of pyocyaneus.

SECTION V.—THERAPEUTICS.

(PHARMACOLOGY, PHYSICAL THERAPEUTICS, BALNEOLOGY.)

President, M. A. DE BÓKAY.
Managing Secretary, M. Z. DE VÁMOSSY.

Dr. A. CURCI (Catania) read a paper on

The Physiological and Therapeutical Importance of the Alkalies and the Alkaline Earths.

In the first part of his paper Dr. Curci discussed the physiological action of potassium, rubidium, cæsium, thallium, sodium, lithium, calcium, strontium, barium, magnesium, and beryllium. He contradicted the commonly held view that potassium is a cardiac depressant, maintaining that it stimulates the muscular elemen[illegible] and strengthens their action. [illegible] splanchnic muscles, as have [illegible] calcium, strontium, and bari[illegible] vascular stimulants. Dr. Curci held that lithium was a nervous stimulant, but had no action on the muscular tissues. The alkaline earths all depressed the functions of the nervous system, but magnesium and beryllium had no action upon the muscles. Dr. Curci advanced a theory of the action of these substances on the various systems in the animal and vegetable organisms. The second part of the paper was devoted to a consideration of the mineral salts in the tissues in health and disease. The interesting observation was made that tissues heated by an inflammatory process absorb salts and other substances more readily than when in the normal state, and this applies to substances which do not normally occur in the tissues. In the third section of his paper Dr. Curci considered the biological rôle of the metals potassium, calcium, and magnesium. Whilst sodium and ammonium increase excitability in the nervous tissues, calcium and magnesium in combination with those tissues control the currents of nervous energy and offer a certain amount of resistance to the conductive power of the nerves. They are accordingly true tonics. He held [illegible] power of the nucleus, [illegible] he described the influence of the [illegible] nutrition and the secretions.

SECTION VI.—INTERNAL MEDICINE.

President, Baron A. KORÁNYI.
Managing Secretary, H. BENEDIKT.

Dr. H. HUCHARD (Paris) read a paper on

Arterio-Sclerosis, including its Cardiac Form.

The chief points of Dr. Huchard's argument were the following. There exists great confusion amongst pathologists as to the nature and process of arterio-sclerosis, more than 20 [illegible] accounts of it having been advanced, so that it is [illegible] ional definition of the dis[illegible] Neither can pure experi[illegible] inical evolution of arterio[illegible] entirely a vascular cha[illegible]

performed on children under eight years of age, and not until all deformity has been [illegible]
must not be performe [illegible]
recovery. It should be [illegible]
epiphysis and so that the bones lie in good apposition. Splints should be worn until consolidation is complete.

SECTION VIII.—OBSTETRICS AND GYNÆCOLOGY.

President, M. G. TAUFFER.
Managing Secretaries, M. CH. SCHMIDLECHNER and M. ET TÓTH.

Dr. VEIT (Halle) read a paper on

The Treatment of Contracted Pelves,

in which he urged that operative interference should only be undertaken when absolutely necessary, and that in all cases perforation of the living child must be avoided. In the highest grades of pelvic contraction Cæsarean section should be performed. In pelves with a moderate degree of contraction, where danger existed to the life of the mother and the child was dead, perforation was the last thing to do. In similar cases with a living child forceps should be tried with care and only for a short time, and if they failed then Cæsarean section should be resorted to. Hebosteotomy should only be practised when fever and signs of septic infection were present. In cases where the life of the child was threatened version should be attempted, and if this failed forceps should be applied and, as a last resort, Cæsarean section. Whenever possible no operative interference at all should be carried out, but any one of these operations might be necessary in certain cases.

Dr. G. WINTER (Koenigsberg) read a paper on

Rapid Dilatation of the Cervix.

He maintained that the ideal method of dilating the cervix must be one which involved no danger of excessive bleeding, of unavoidable lacerations of the cervix, or of the risk of infection, which would allow of the passage of a full-term child and permit of a complete restoration of the functions of the cervix. Two methods were available—stretching or cutting of the tissues. The former could be carried out manually, by means of a hydrostatic dilator, by a dilator such as that of Bossi, or by the body of the child. Manual dilatation possessed the advantage of requiring no special apparatus, but there was a danger of slight tears of the cervix and of septic infection. The use of a hydrostatic dilator secured complete dilatation which could be carried out aseptically; it possessed the disadvantage, however, of the likelihood of reclosure of the canal from elastic recoil. Bossi's dilator was a certain method and without danger when the cervix was unfolded, and entailed but slight danger of infection, but the risk of bad tears was considerable, and interference with the third stage of labour was not uncommon. Dilatation by means of the child's body after version [illegible]
the deat [illegible]
incisions [illegible]
section [illegible]
Dührssen's method was the best; with this procedure [illegible] quent and [illegible] child was [illegible] ion when [illegible] 20 cases were recorded, in all of which the fits at once ceased after the performance of the operation. In accidental hæmorrhage, if immediate delivery was necessary, vaginal Cæsarean section gave good results. In placenta prævia all methods of rapid dilatation were best avoided because of the risk of rupture of the cervix. In cases of septic infection also any method likely to produce tears of the cervix should not be practised. In cases where the death of the child was threatened only those operations should be performed which entailed no risk to the life of the mother. Of general conditions, eclampsia, heart failure, impending suffocation from acute lung affections, and at times tumours of the genitalia, stenosis of the cervix, and impending death of the mother, were all indications for the performance of vaginal Cæsarean section, which he considered on the whole by far the best of the various methods available for rapid dilatation of the cervix, and for which eclampsia was the strongest and most important indication.

Dr. A. MARTIN (Berlin) read a paper on

Myomata and Fertility.

He said that as a result of the great number of observed cases of pregnancy in myomatous uteri it was no longer possible to maintain the old opinion that myomata prevented intra-uterine development of the ovum. Modern views as to the causes of sterility were also incompatible with this doctrine. The abundant hyperplasia of the ovaries in myoma was probably responsible, in the first place, for the remarkable observation that elderly women suffering from myoma and marrying late in life soon became pregnant, and, in the second place, for the delay in the occurrence of the climacteric in myomatous subjects. The observed cases of married women who conceived after removal of myomata, although they had previously been barren, were not sufficiently numerous to decide the question; there were, moreover, many associated conditions which could not be definitely ascertained.

SECTION IX.—OPHTHALMOLOGY.

President, M. E. DE GRÓSZ.
Managing Secretary, M. M. C. SCHOLTZ.

Dr. W. UHTHOFF (Breslau) read a paper on

The Eye Symptoms in Disease of the Pituitary Body and Acromegaly,

in which the cases of hypophyseal tumours with and without acromegaly were distinguished for purposes of differential diagnosis. Rare cases of acromegaly with other cerebral affections were enumerated. The results were founded upon 328 necropsies. Temporal hemianopia is the most constant symptom; typical choked disc and slight papillitis each occurred in about 5 per cent. of the cases, simple atrophic pallor of the discs in 20 per cent., and central scotoma only in occasional cases. Paralysis of ocular muscles, generally affecting the oculo-motor nerve, occurred in 10 per cent. of cases, and nystagmus in 6 per cent. The clinical course of the visual defects was then considered in detail and compared with the observations of other [illegible]
the relative frequency of the [illegible]
of the hypophysis. The pathog [illegible]
ptoms was discussed from the anatomical standpoint, and finally such other trophic and metabolic disturbances as obesity, disorders of the genital apparatus, and so on.

Dr. ELSCHNIG (Prague) communicated a paper on

Prevention of Infection in Operations upon the Eyeball.

His investigations have led him to the conclusion that in spite of careful antiseptic or aseptic precautions post-operative infection originates exclusively in the conjunctival sac, with the sole exception of rare endogenous infections. In all cases, therefore, in which the globe is to be opened the bacteria of the conjunctival sac should be examined and operation undertaken only if pathogenic organisms, especially streptococci and pneumococci, are absent. The most trustworthy methods are by culture experiments on both solid and fluid media, such as serum bouillon and serum agar plates. The use of pyocyanase and perhaps mercury oxycyanate is most to be recommended for the elimination of pathogenic organisms. Immunisation procedures and even disinfection of the field of operation have little or no value, but general infection and disease of other organs must be treated. When infection of the conjunctival sac is suspected, the greatest care m [illegible]
operative procedure. [illegible]
conjunctival area, anc [illegible]
e.g., subconjunctival [illegible]

Dr. ANGELUCCI (Naples) read a paper on

Post-operative Inflammations of the Eye caused or promoted by Auto-infection.

[illegible] sometimes inappreciable to the patient, may cause post-operative inflammation in the eye. 1. Diseases of metabolism.—(*a*) [illegible] by a slight [illegible] old people an [illegible] upon the excretion of [illegible] post-operative course in cataract extraction. In Bright's disease iritis occurs almost always, sometimes after simple iridectomy, especially if the disease is advanced. (*b*) Diabetes:

Cataract extraction may be free from inflammatory complications and consecutive hæmorrhage in diabetics of good constitution. In the late dystrophic stages, usually associated with albuminuria, even if the sugar excreted in the [illegible] n quantity untoward results are to [illegible]: This disease affords no contra- [illegible] traction. Gouty attacks occurring [illegible] alescence do not appear to exercise [illegible] hen gout is accompanied by consti- [illegible] ces of the intestinal tract there [illegible] y from inflammation. 2. Diseases of the mouth.—In these cases iritis is common after extraction of cataract and may eventuate in suppuration. 3. Affections of the gastro-intestinal tract.—Constipation and disorders of digestion are a potent cause of post-operative iritis. It occurs from the fourth to the eighth day and is ushered in by increased conjunctival secretion, often affecting both eyes. 4. Diseases of the bladder.—Dr. Angelucci has seen two cases of iritis in iridectomy associated with chronic vesical catarrh in spite of minute precautionary measures. Extraction of cataract has been followed by hyperæmia of the iris, although sero-therapy was employed. 5. Influenza.—A case of cataract extraction during an attack of influenza resulted in the loss of eye from panophthalmitis. 6. Furunculosis and abscesses.—Hypopyon ulcer supervened on an iridectomy in a patient with boils, and the eye was lost from panophthalmitis in an old man who had an abscess and was operated upon for cataract.

Dr. FELIX LAGRANGE (Bordeaux) made a communication on

The Treatment of Chronic Glaucoma.

He began by passing in rapid review all the means, medical, surgical, and operative, which have been employed in the treatment of glaucoma, and he laid particular stress on operations designed for lessening ocular tension. He dealt with iridectomy and sclerotomy as well as section of the sympathetic, and gave it as his opinion that all the intra-ocular operations only succeeded very imperfectly in attaining the object of the perfect operation—namely, a fistulous or filtration cicatrix by which evacuation can be effected when the tension is too high. Dr. Lagrange described his operation for this end in precise terms. It consists essentially in a sclerectomy made at the level of the canal of Schlemm, and comprising all the thickness of the sclerotic. The incision should be made in such a way as to cut the insertion of the ciliary muscle, by which means the choroidal space will be brought into communication with the anterior chamber. The section of the sclerotic opens a free passage for the intra-ocular fluids, which can thus drain out under the conjunctiva. Dr. Lagrange added that in eyes with permanently increased tension sclerotomy should be followed by an iridectomy in order to avoid the inclusion of the iris. In cases of simple chronic glaucoma where *the increase in tension is intermittent* or very slight, simple sclerotomy should suffice to produce an effective filtration cicatrix.

SECTION X.—DISEASES OF CHILDREN.

President, M. J. DE BÓKAY.
Managing Secretary, M. P. HEIM.

Dr. J. P. CARDAMATIS (Athens) read a paper on

Infantile Malaria,

a subject which is, of course, of particular importance in Greece at the present day. He began by pointing out that children at the breast are less attacked with malaria than at any other age, infants during the first year of their age enjoying a great comparative immunity. During the second year of life the liability to attack is not much increased, but between the ages of from two to seven years, and for some reason or other especially between the ages of from two to three, children are particularly subject to the poison of malaria. Dismissing with a few words the idea that paludism of the mot [illegible] or, indeed, that it could have any p [illegible] health of the fœtus, Dr. Cardamatis [illegible] constantly led to believe the placen [illegible] antitoxic material which resists the [illegible] rnal hæmatozoa, destroying them at the surface of t [illegible] among nurslings and little children th [illegible] in susceptibility to malaria, the same [illegible] ng met with as prevails among the indigenous inhabitants of tropical regions, though perhaps on a somewhat lower scale. Contrary to what has been affirmed by Plehn, the form of paludism which confers immunity does not always result in anæmia. The natural immunity which has also been observed among children entirely differs from that relative immunity mentioned by Koch, which is due to a great frequency of infection during childhood. It differs also from that immunity which has been observed by Celli in the environs of Rome, and which is attributed to the periodical development and exhaustion of intensity of epidemics. Both the child and the adult in Greece are most frequently attacked with æstivo-autumnal malaria of the tertian type.

SECTION XI.—NEUROLOGY.

President, M. E. JENDRÁSSIK.
Managing Secretary, M. CH. SCHAFFER.

Professor H. OPPENHEIM (Berlin) read a paper on

The Diagnosis and Treatment of Tumours within the Spinal Canal,

in which he came to the following conclusions: 1. The differential diagnosis between tumours springing from the meninges and from the spinal column itself can scarcely be said to be yet [illegible] 2. For the diagnosis between intramedullary [illegible] new growths important but not absolu [illegible] ptoms are existent. Of these the chief is the constancy of the upper level of the lesion. Nevertheless, the collection of cerebro-spinal fluid above the tumour and the frequently accompanying meningitis serosa circumscripta may cause this level apparently to vary and thereby reduce its diagnostic value. For other reasons also the upper level may seem higher than it really is. Criteria for distinguishing between meningeal tumours and spinal gliosis are not trustworthy. 3. Serous spinal meningitis presents more of the characteristics of spinal tumours than any other extramedullary disease. The author thinks that the aids to differential diagnosis mentioned by Sir Victor Horsley cannot be depended on. 4. Spinal medullary "pseudo-tumours" are to be considered with reserve. 5. The segmental diagnosis of spinal tumours may be complicated by the existence of secondary serous or fibrous meningitis. The symptoms of a tumour may be referable to a level below the site of the tumour. Therapeutic results are distinctly encouraging. Reference was made to 25 cases of operation, with 13 cures.

Dr. SICARD (Paris), in a paper on

The Treatment of Facial Neuralgia by Injections of Alcohol,

said that not all so-called facial neuralgias are capable of being treated by alcohol injections, but only those of peripheral origin and "true" facial neuralgia. For the peripheral group the foramina usu [illegible] he *supra*- and infra-orbital and the mental [illegible] p are the inferior dental canal and the [illegible] canal; the deep foramina are the foramen rotundum and the foramen ovale. The best medium is 80 per cent. alcohol, with menthol (2 per cent.) and novocaine (1 per cent.). Dr. Sicard has met with no complications whatever beyond a local œdematous reaction. The cure lasts from one to two years, at the end of which time the treatment can be repeated. The method is of no value unless the trunk of the nerve is penetrated by the alcohol, the evidence of which is anæsthesia persisting in the distribution of the branch involved.

Professor FRANKL-HOCHWART (Vienna) discussed

The Diagnosis of Hypophyseal Tumours without Acromegaly.

He gave an analysis of 155 cases collected from the literature, as well as some private cases, and noted the occurrence, apart from the general symptoms of intra-cranial growth, of psychical disturbanc [illegible] frequent in these patients; [illegible] sometimes opt [illegible] polydipsia, an [illegible] tients are often [illegible] otence and amenorrhœa are [illegible] est of sexual development and a degree of adiposis are often met with (degeneratio adiposo-genitalis). The duration of the disease is from several months to 30 years. Tumours of the pineal body may present somewhat similar features, while there are certain forms of constitutional adiposity and certain cases of diabetes insipidus in children that may require to be differentiated.

SECTION XIII.—DERMATOLOGY AND VENEREAL DISEASES.

President, M. S. Róna.
Managing Secretary, M. E. Basch.

Sir **Malcolm A. Morris** (London) read a paper on

The Treatment of Lupus Erythematosus.

The disease appeared to him to be essentially a chronic inflammation of the skin, local in origin, and depending on a condition of the circulation which makes the integument prone to vaso-motor disturbance. This may cause a predisposition to toxic infection, but neither the fact of such infection nor its nature has been positively demonstrated. Each [illegible] peculiarities. The [illegible] Under the former head must be included careful regulation of the diet, so that the intestine may not be loaded with materials that may form a favourable soil for infection. Anything, like coffee and tea, which causes flushing of the face, is contra-indicated. Quinine is often useful. Locally, in the hyperæmic stage, he prescribed cooling lotions and ointments of subacetate of lead. Ichthyol in the form of a lotion or an ointment he also found to be among the most useful of local remedies. In chronic cases the constant application of a strong solution of ichthyol is the best remedy, but iodine liniment is also valuable. In severe conditions linear scarification or light touches of the thermo-cautery he found oft[illegible] ome- tim [illegible] the Fin [illegible] are par [illegible] kening of the integument. *Radium may be applied to limited areas for the same purpose.*

SECTION XV.—RHINOLOGY AND LARYNGOLOGY.

President, M. E. de Navratil.
Managing Secretary, M. Z. Donogány.

Dr. **M. Grossmann** (Vienna) read a paper on

Nasal Asthma.

He said that experimental researches undertaken in the hope of explaining the phenomena of nasal asthma showed that electrical or mechanical irritation of the nasal mucous membrane led to a notable disturbance of the cardiac function, followed by a considerable engorgement of blood in the pulmonary circulation and by an increase in the external dimensions of the lung. In curarised animals this increased volume of the lung caused a rise of pressure in the intrathoracic space and a depression of the diaphragm. This effect of nasal irritation was completely absent if either the second branch of the trigeminus nerve or the two vagus nerves were previously divided. There was therefore reflex action in a curved path the centripetal portion of which was formed by the vagus nerve. This enlargement of the lung was not caused exclusively by the accumulation of blood, but also by the fact that [illegible] pulmonary capacity—i.e., the available pulmonary area—[illegible] creased in direct proportion to the engorgement with blo[illegible] The lung became larger not only as regards its external dimensions, but also as regards its intrapulmonary capacity. In accordance herewith the intrapulmonary pressure, unlike the pressure in the intrathoracic space, fell when the pulmonary circulation was engorged with blood. This enlargement of the lung was accompanied by rigidity which seriously interfered with respiration.

Dr. **Citelli** (Catania) read a paper on

Adenoid Growths.

After referring in his historical remarks to the very great merit of Meyer in making known to the scientific world such a frequent and important disease, he recorded briefly the normal and pathological anatomy of the tonsil, founded also on extensive researches of his own. He dealt with cystic formations under a separate heading. He maintained that in order to be able to establish with some [illegible] is required of the normal evolution of the tonsil in man, and not only extensive clinical knowledge in regard to it but anatomical knowledge besides, obtained by means of systematic observations made on dead bodies. As regards the normal [illegible] referri [illegible] expres [illegible] are of [illegible] beside [illegible] of their position they may also serve as a means of exit for infection, and in some cases, when the defensive elements are not sufficient for their purpose, as a means of ingress. He does not believe that the tonsils belong to the organs concerned with internal secretion, but in view of certain general or secondary disturbances which are found in subjects with adenoids, and which often disappear after an operation, and more especially on account of certain anatomical researches of his own, he believes it probable that hypertrophy of the tonsil alone can determine both functional and anatomical changes in the whole pharynx. As to etiology, he divides the causes of this condition into congenital and acquired; these latter, however, will only provoke the growth of adenoids in predisposed subjects. He divides adenoid symptoms into local symptoms—disturbances in nasal respiration and its relative consequences, disturbances in the other respiratory organs, vocal disturbances, auricular disturbances, and general or secondary symptoms—alterations in the circulation, psychic disturbances, exophthalmos, spasms of the larynx, night-terrors, nocturnal enuresis, and nervous cough, and he deals briefly with each of the above-mentioned symptoms. The treatment in the majority of cases is operative. Almost all the instruments designed for the purpose are good, in experienced hands, the best of all, however, being the spoons with a ring and adenotomes. Among the various ringed spoons he gives the [illegible] che, and when operating on a [illegible] modified by himself as to its [illegible] Delstanche's, and, finally, a very small size that he has made and which is used for lateral growths and for growths in unweaned infants. Finally, he points out the social importance of adenoid growths, which can exert a great influence over the physical or psychological development of individuals, and hence the great utility of making such a disease and its consequences known to the public.

SECTION XVI.—OTOLOGY.

President, O. de Lichtenberg.
Managing Secretary, B. Szenes.

Dr. **E. Schmiegelow** (Copenhagen) read a paper on

The Indications for the Operative Treatment of Secondary Suppurative Labyrinthitis and the Method of Treatment.

The paper was based on the observed results of 42 cases of labyrinthitis following purulent conditions of the middle ear. In ten cases the labyrinthitis was either of the partial circumscribed or else of the serous type, and they all [illegible] of the cavity of the [illegible] consisted of diffuse [illegible] complete deafness. [illegible] not indicated in all the cases of secondary lesions of the labyrinth; the indications for this operation were not derived solely from the [illegible] into the cavity of the labyrinth. The labyrinth might be opened in various ways. The method recommended by Jansen and Neumann ought not to be the principal one. [illegible] fiable [illegible] to the [illegible] the [illegible] with [illegible] chisel [illegible] on to [illegible] orde [illegible] was [illegible] and after this the semicircular canal, the vestibule, and the cochlea were opened. In this manner the facial nerve could be preserved during the complete removal of the labyrinth. At the end of the operation the nerve could be seen descending freely through the cavity which was left. In 22 of the 32 cases of purulent diffuse labyrinthitis the treatment consisted only in performing the radical operation on the middle ear. Of these 22 cases two died from complications existing previously to the operation. Of the remaining 20 patients two died, whilst 13 (i.e., 65 per cent.) recovered.

SECTION XVIII.—HYGIENE AND IMMUNITY.

President, M. L. DE LIEBERMANN.
Managing Secretary, M. P. KLASZ.

Dr. TAAV. LAITINEN (Helsingfors) read a paper giving a general view of

Recent Researches on the Hygienic Importance of Alcohol.

He summarised his conclusions under the four following heads: 1. The importance of alcohol as an article of food is rendered very questionable by recent researches. 2. These researches prove that alcohol diminishes the natural power of the tissues to resist injury, promotes degeneration, and has a disastrous effect on future generations. 3. The questions of relation of alcoholic liquor to crime and of the manufacture and sale of such beverages deserve the serious consideration of the legislature. 4. It is the duty of medical men to direct more attention than formerly to the alcohol question, and by careful study to decide whether recent researches are justified or not in regarding alcohol and alcoholic beverages as a poison and one of the principal causes of degeneration in the human family; they ought also to consider whether it would not be advisable in medical practice, and especially in hospitals, either to banish it altogether or at least to prescribe it with the same care as other poisonous drugs. In this matter the attitude taken up by medical men as representatives of public hygiene was of quite exceptional importance, and afforded an illustration of the passage in Homer, quoted by Bornstein, to the effect that one physician was of more consequence than a number of other men.

SECTION XX.—MILITARY AND NAVAL SANITARY SERVICES.

President, J. KEPES.

Managing Secretary, A SZEPESSY.

Dr. LARRA Y CEREZO (Madrid), in a paper on

The Sanitary and Hygienic Matériel of Armies, with Especial Relation to the Spanish Army,

pointed out the importance of the sanitary *matériel* in modern warfare, and described the units approved in the Spanish army from the point of view of the provision of sanitary and hygienic *matériel*. As a result of this plan each division of the Spanish army will take into the field a complete hospital, with every necessary appliance for 200 beds, distributed among 16 tented wagons. As a complement to this hospital installation the division is further equipped with four wagons, each containing surgical and medical appliances, each with 300 dressings, and the pharmaceutical necessities and material for clinical investigation in the hospital; four wagons of appliances; a food-supply wagon, which provides food for the hospital of 200 cases for six days; and 24 ambulance wagons. All these units correspond to the divisional field ambulance and the divisional hospital. The latter also has at its disposal a disinfecting stove, bath, apparatus for sterilisation by heat and by ozone, a reservoir wagon of water with a filter, and another for chemical and bacteriological analysis and for radiographic investigation. In the regiments the *matériel* for sanitary service include the following sealed patterns: First, a first field dressing for each man; second, an emergency knapsack for each company; third, a medical saddle-bag or wallet for each squadron or battery; fourth, a medical haversack; fifth, a medical chest per battalion; sixth, a reserve chest per battalion; seventh, a medical vehicle for each battalion; eighth, a case of surgical instruments; ninth, a case of amputation instruments for mounted corps; tenth, a service stretcher; eleventh, a Swedish chair; and twelfth, an ordinary litter. Each army corps has a hospital train. Spain has three large establishments to provide all the raw material, and sealed patterns of *matériel*, including vaccines, prophylactic and therapeutical serums, drugs, &c. These establishments are: the Military Health Park, the Central Medical Laboratory, and the Institute of Military Hygiene. All the sanitary units assigned to each division in time of war are calculated to provide the division with about 46,000 to 49,000 dressings—that is three per head, one first field dressing, and two for secondary treatment. Dr. Larra y Cerezo terminated his report by some general remarks on the subject of what the medical service and its *matériel* should be in modern warfare.

OPENING OF THE LONDON MEDICAL SCHOOLS.

Winter Session, 1909-10.

St. Bartholomew's Hospital.—The session will commence on Oct. 1st, and the old students' dinner will be held on the same evening in the great hall of the hospital.

Charing Cross Hospital.—The session will open on Oct. 4th by the annual distribution of prizes and an address to the students in the out-patients' hall at the hospital at 4 P.M. The dinner of the past and present students will take place on the evening of the same day.

St. George's Hospital.—The session will begin on Oct 1st at 3 P.M., Dr. H. D. Rolleston being orator for the day. He will take for his subject, "St. George's and the Progress of Physic." The oration will be followed by the annual meeting of the St. George's Club. The annual dinner will be held at the Prince's Restaurant on the evening of Friday, Oct. 1st, at 6.30 for 7 o'clock, Mr. A. Marmaduke Sheild, consulting surgeon to the hospital, in the chair. Tickets may be obtained from the honorary secretaries, Medical School Dinner, St. George's Hospital, S.W.

Guy's Hospital.—The opening of the session will be marked by the first meeting of the Pupils' Physical Society, the exact date of which has not yet been fixed.

King's College Hospital.—The session will open on Oct. 1st. No opening address will be delivered. The old students' dinner will be given.

London Hospital.—The session will open on Oct. 1st. In the afternoon a reception by the staff for old students will take place in the library of the Medical College from 3 to 5 o'clock. The old students' annual dinner will be held on the evening of Oct. 1st at 7.30, at the Savoy Hotel, when Dr. F. J. Smith will be in the chair. The honorary secretaries of the dinner committee are Dr. Hunter Tod, 111, Harley-street, W., and Dr. Lewis Smith, 25, Queen Anne-street, S.W.

Middlesex Hospital.—The opening address will be given by Dr. J. Strickland Goodall in the large theatre at 3 P.M. on Oct. 1st, after which the prizes will be distributed. The annual dinner will be held the same evening at the Trocadero at 7 o'clock, at which Mr. John Murray will be in the chair.

St. Mary's Hospital.—The opening of the session, on Oct. 1st, will be marked by the distribution of prizes, which will be presented by Dr. H. A. Miers, F.R.S., Principal of the University of London, at 3 P.M. The annual dinner of past and present students will be held the same evening at 7 o'clock at the Café Royal.

St. Thomas's Hospital.—The commencement of the session will be marked by the old students' dinner, which will be held at the Hotel Cecil on Oct 1st.

Westminster Hospital.—The session will begin on Oct. 4th, and the annual dinner will take place on Tuesday, Oct. 5th, at Oddenino's Imperial Restaurant, Dr. R. G. Hebb being in the chair. The secretary of the dinner is Mr. J. M. G. Swainson, 9, Welbeck-street, W.

University College Hospital.—The session will open on Oct 4th.

London (Royal Free Hospital) School of Medicine for Women.—The winter session will open on Oct. 1st, when Mrs. Fawcett, LL.D., will deliver the inaugural address at 4 P.M. Mrs. Garrett Anderson, M.D., will be in the chair.

THE LANCET.

LONDON: SATURDAY, SEPTEMBER 4, 1909.

The Working of the Midwives Act.

THE Report of the *Departmental Committee appointed by the Privy Council* at the end of last year to consider the working of the Midwives Act, 1902, has just been issued with Appendices and Minutes of Evidence, and constitutes a *most* valuable document which requires careful study by the medical profession. The Committee was a decidedly strong one, Sir ALMERIC FITZROY, Clerk to the Privy Council, *being in the chair*; Mr. H. J. STANLEY, private secretary to the Lord President of the Council, being one of the secretaries; and Dr. F. H. CHAMPNEYS, chairman of the Central Midwives Board; Dr. A. H. DOWNES, Senior Medical Inspector for Poor-law Purposes to the Local Government Board; and Mrs. ROBHOUSE, chairman of the *Executive Committee of* the Rural Midwives Association, having also seats. The other members of the committee were Mr. J. S. DAVY, C.B., assistant secretary and chief general inspector to the Local Government Board; Mr. F. E. FREMANTLE, medical officer of health to the county of Hertford; and Mr. J. TAYLOR, one of the principal clerks of the Home Office. The weak spot in an able court of inquiry, as we indicated when its proposed *personnel* was made public, is the absence of any member directly representing the interests of the general practitioner which are so closely involved with the working of the Midwives Act. It is true that much valuable evidence was laid before the Committee by Dr. J. H. TAYLOR, the *secretary of the Medical Guild of Manchester and* a well-known general practitioner in Salford, by Dr. L S. MCMANUS of Wandsworth, one of the Direct Representatives of the medical profession on the General Medical Council, by Mr. O. E. S. FLEMMING of Bradford-on-Avon, by Dr. HUGH WOODS, *secretary of the London and Counties* Medical Protection Society, and by the British Medical Association through Mr. J. SMITH WHITAKER; and that due attention was paid to their evidence is proved by the recommendation of the Committee that medical practitioners summoned by *midwives to* assistance in a case of emergency during labour should have a secure expectation of payment. But we cannot help feeling now, as we felt at the time of the appointment of the Committee, that room might well have been found for a general practitioner of experience The conditions which should be deemed to come within the category of emergency would perhaps have been discussed in a more practical manner if a general practitioner had been present to assist in the collating of the evidence offered by his colleagues. It would not, however, be generous to lay any stress on this point in view of the fact that the Committee has fully recognised the right of medical practitioners, summoned in an emergency by the midwife, to a certainty of remuneration.

The Report shows, contrary, perhaps, to what many of our readers would have expected, that the working of the Act has been on the whole satisfactory. Medical officers of health have testified to the spirit in which local supervising authorities have interpreted their duties, and Dr. A. NEWSHOLME, principal medical officer of the Local Government Board, has supplied in the form of an appendix (Appendix III.) an interesting memorandum claiming the Act as an effective instrument in the promotion of public health. *In doing this he quotes the first Appendix to the* Report, which gives statistical information with regard to mortality in England and Wales from puerperal sepsis and from the accidents of childbirth. "Puerperal sepsis" here includes puerperal septicæmia, puerperal septic intoxication, puerperal pyæmia, and phlegmasia alba *dolens*; while "accidents of childbirth" include abortion, miscarriage, puerperal mania, puerperal convulsions, placenta prævia, and flooding. The figures in relation to the incidence of these conditions are presented in three tabular statements: (1) a *table showing in respect of the years 1888–1907 inclusive* the number of deaths of females in England and Wales from puerperal sepsis, and the annual death-rates per 1,000,000 females living; (2) a table showing the rate of mortality from puerperal sepsis in England and Wales calculated in the proportion to 1000 births; and (3) a table showing the death-rates from puerperal sepsis and accidents of childbirth in England and Wales to 1000 births. The figures show that the death-rates from puerperal sepsis per 1000 births have been steadily dropping through England and Wales between 1889 and 1907. The rate had therefore declined considerably by 1903, when the Midwives Act came into operation, so that exactly what proportion of any further decline is due to the administration of the Act cannot be gauged. But Dr. NEWSHOLME considers, and we believe that medical practitioners agree with him, that there can be no reason to doubt that the Act has borne *a share in the improvement.* The Committee has adopted this view, holding that the decline in puerperal sepsis, having synchronised with the period of statutory regulation of female midwifery practice, cannot be treated as without significance, adding, however, to *this reserved expression* of opinion that it will not quote the figures "as conclusive evidence of causal connexion." This caution is necessary, for it must be remembered *that there* was considerable delay in many localities in setting up the necessary machinery for carrying out the regulations of the Act, so that exactly when the influence of the Act began to make itself *generally* felt cannot be stated. Something the *same uncertainty* must prevail, for the present at any rate, as to the incidence on the population of ophthalmia neonatorum, for the *figures* placed *before the* Committee do not *lend themselves* to any certain deductions. In this connexion some highly valuable evidence was given by Mr. SYDNEY STEPHENSON, ophthalmic surgeon to Queen

Charlotte's Hospital, London, and recently chairman of the committee appointed by the British Medical Association to inquire into the subject. Mr. STEPHENSON pointed out to the Committee that this disease, which is largely preventable, and which also is very amenable to treatment if the cases are taken in time, was responsible for almost a third of our admissions to asylums, retreats, and institutions for reception of the blind. He suggested that the disease should be compulsorily notifiable all over the country to sanitary authorities, when the public would immediately begin to inquire into the nature of ophthalmia, would become aware of the prevalence of the disease and of its enormous influence in causing blindness, and would be ready to assist in its prevention. He quoted from a report made by Dr. A. NIMMO WALKER, honorary surgeon to St. Paul's Hospital and School for the Indigent Blind in Liverpool, which describes the result of obtaining early knowledge by a system of notification of every case of ophthalmia occurring in the practice of the midwives in Liverpool. The scheme under which the ophthalmia ward in St. Paul's Hospital came into existence will be found in a paper published in THE LANCET of May 2nd, 1908. Under this scheme, as soon as the midwife discovers any sign of inflammation in an infant's eyes she notifies the case to the health department and arrangements are made for the summoning of a practitioner, a contingency which is provided for under the Midwives Act. If the parents are too poor to pay for the treatment of the child in its home it is removed to St. Paul's Hospital. The scheme has been under trial for 18 months and is found to be practicable and also to lead to good results. As, in most cases, for the proper working of the scheme, both mother and child have to be received into the hospital, it is obvious that the door may be opened to other difficulties, but as far as the treatment of a terrible disease is concerned there can be no doubt of its efficacy. The Committee appends Mr. STEPHENSON'S evidence to the report, and his views have also the support of Dr. NEWSHOLME. As a consequence, the Committee recommends that the rules of the Midwives Board in relation to ophthalmia neonatorum should be strengthened by making it the duty of the midwife to summon medical help whenever she notices symptoms indicative of danger. Her present duty under Clause 17 of the rules of the Central Midwives Board is defined as follows:—whenever after delivery the progress of the woman or child is not satisfactory, but in all events upon the occurrence of the condition in the child (*inter alia*) of "inflammation to even the slightest degree of the eyes, eyelids, and ears," a midwife must decline to attend alone, and must advise that a registered medical practitioner be sent for. So that the existing instructions seem to cover all the necessary ground, but ophthalmia neonatorum is so terrible a scourge that we welcome any more vigorous measures for its early and effective treatment.

For the present we are leaving out of consideration a number of most interesting medical points with regard to the supply and training of midwives which have been carefully considered by the Committee. This will be seen by perusal of the full summary of the recommendations of the Committee which we print in another column (see p. 742). The fact that these recommendations, though no one of them may be in the nature of sweeping change, should be so numerous, proves that an inquiry into the working of the Act had already become necessary. If it had been possible to wait a little longer undoubtedly some of the evidence laid before the Committee would have been more conclusive in character, especially the statistical side of the inquiry would have had more definite results; but where there are so many things to be said it was clearly time that a beginning of the saying of them should be made. We will confine ourselves here to noticing the recommendations for ensuring payment of medical practitioners when summoned by midwives. With regard to the remuneration of medical men the Committee had no difficulty in coming to the conclusion that an obvious and extraordinary grievance must be removed. The flaw in the Midwives Act by which the midwife was ordered to obtain medical assistance in certain cases while no arrangement was forthcoming for the payment of such assistance, was pointed out as soon as the provisions of the intended legislation were made public, but the importance of the point escaped attention, owing, probably, to the fact that discussions upon the registration of midwives were usually conducted upon the more general question as to whether legislation was necessary rather than upon any details of a particular proposal. The Act accordingly placed upon midwives the statutory duty of summoning to their assistance medical practitioners in cases of emergency, but made no provision for the payment of the practitioners. Upon medical men there was thus placed a very serious onus, and one which they have never ceased to consider absolutely unfair. They were liable to be summoned at any moment by a midwife to attend in a case of emergency, and they had to make up their minds at once whether they would work for nothing. The ordinary run of midwifery practice had been largely taken from them by the Midwives Act, but the difficult cases came back to them through the medium of the midwives, and while all these cases presented themselves as emergencies the chances of payment for arduous and responsible ministration were exceedingly small. In the circumstances many medical practitioners refused to attend these emergency cases, while no guarantee was forthcoming that their services would be remunerated, resenting the fact that they should be perpetually expected to forego fees through a sense of humanity. Although the refusals to respond to the calls of midwives were rarely absolute, being very usually relaxed if special circumstances could be shown to exist; still the medical profession was able to show that an amendment of the law was absolutely necessary. Some public health authorities, recognising the unjust position in which medical men were placed, expressed themselves as willing, without waiting for amendment of the law, to be responsible for medical fees where practitioners had responded to the call of midwives, and this spirit might have spread; but it is clearly more satisfactory that the whole Act should be amended. When this is done we trust it will be done fairly, and that the position of the medical man summoned to attend, for example, a case of puerperal fever will be considered. The attendance may be prolonged, and this must be remembered in any arrangement about fees.

Recent Work in Proctology.

IT is only within the last few years that the surgery of the rectum has reached the dignity of a special department of medical science, and even at the present time many in this country would be unwilling to acknowledge the need for any such specialism. Yet it must be confessed that a knowledge of the diseases of this portion of the body has lagged behind somewhat in the general advance of medicine and surgery, a fact which justifies methods of organisation for the making of special researches. It is only in America, however, that a special society has been formed for the study of proctology, and the eleventh annual meeting of the American Proctologic Society was held in June last at Atlantic City, New Jersey. We have before us a report of the proceedings at the meeting and the contents are sufficient to demonstrate to the most sceptical that much is being learned about the maladies and the surgery of the rectum. One of the more important of the many useful and interesting papers was on the use of spinal anæsthesia in rectal surgery by Dr. COLLIER J. MARTIN. He reported a series of 87 cases in which he had employed it; in the majority of these the reason for using this method of anæsthesia was the presence of pulmonary tuberculosis, and the cases treated were nearly all fistulæ or hæmorrhoids. There were two cases of rectal carcinoma removed by the perineal route, and the remaining operations were comparatively trivial. Dr. MARTIN claimed that under spinal anæsthesia the local condition is perfect for the performance of rectal operations, for the sphincters are completely relaxed, there is an entire absence of muscular spasm, and especially there is no venous engorgement which is so commonly seen in patients under ether anæsthesia; as a result of this the hæmorrhage is more easily controlled. Spinal anæsthesia is certainly well suited for rectal work, but the method is not yet perfect. In the first place, it is not desirable in cases where the hips have to be raised above the level of the rest of the body, for there is no small risk that the injected fluid may travel upwards towards the cervical region and the medulla, and so give rise to dangerous symptoms. The after-effects also are not negligible, for in 18 cases headache followed the operation, coming on from one to three days after, but in only three of the cases was the headache really severe, lasting more than a day or two. A few of the patients complained of some stiffness of the back of the neck and shoulders, and in one case a temporary oculo-motor paralysis developed, though it recovered under treatment. There is much to be said in favour of spinal anæsthesia for operations on the rectum, but the present method of using it is so often followed by headache that most surgeons not unnaturally hesitate to employ it except in cases unsuitable for the administration of a general anæsthetic.

The question of the treatment of pruritus ani is sure to find a place in any series of papers on the surgery of the rectum, and at this annual meeting several papers were read dealing with this subject. While many of the cases are amenable to simple local or dietetic treatment, there remain some which refuse to respond to any of the ordinary methods, and these are the cases which have taxed the resources of the surgeon. On the whole, the method of treatment for the more intractable cases which is now most widely employed is that devised by Sir CHARLES BALL; it consists in making elliptical incisions round the anus and then raising the flaps of skin so marked out and replacing them. In this way all the cutaneous nerves of the part are severed, and the irritation ceases at once. Dr. LOUIS J. KROUSE of Cincinnati reported a case in which BALL's operation had been performed for pruritus ani and the flap of skin sloughed, and he pointed out that the elliptical incision cut off the greater part of the circulation of the skin of the part, and was not essential for the success of the operation. Dr. KROUSE has devised a modification of the method which is, he thinks, equally effective and not liable to be followed by sloughing. The operation is performed by making six or eight incisions radiating from the anus. The skin lying between these radial incisions is then undercut until the whole of the circumanal skin is undermined. After all the flaps are loosened, except at their extremities, they are replaced and sutured. The method may be a valuable modification of Sir CHARLES BALL's operation, and it deserves an extended trial. The original method has been very effective in the treatment of the more intractable cases of pruritus ani, and though sloughing of the flaps is a very rare sequela of it, any modification which will prevent the possibility of this result will be a definite improvement.

There was one other paper which needs mention—on cæcostomy. The value of an opening into the appendix by which the large intestine can be irrigated in cases of colitis is more recognised in America than in this country, though even here there are a few who perform the operation. Dr. S. G. GANT of New York prefers to open the cæcum instead of the appendix, as a cæcostomy allows the surgeon to irrigate either the small or the large intestine at will; moreover, the appendix is in many cases unsuitable for irrigating purposes as it is often too short or too narrow, or fixed by adhesions; it tends sometimes to slip back into the abdomen and its lumen readily becomes closed unless kept open by the regular introduction of a catheter. Dr. GANT's suggestive paper will probably lead to trial of his methods and in this way we may obtain a series of comparative results which will help the surgeon in his choice of procedure in particular cases.

The Elusive Ether.

CHEMISTS may well be jealous of the progress which physicists are making in their attempts to unveil the mysteries of the ether. Not many years ago no less a distinguished chemist than MENDELEEFF sought to claim the ether as a definite chemical entity, placing it with the other elements in his periodic classification, and regarding it as the lightest ultimate gas endowed with a high penetrating power. The latest word from the physicist on the subject is contained in Sir J. J. THOMSON's Presidential Address to the British Association for the Advancement of Science at Winnipeg last week, an abstract of which we print in another column in our present issue. Coming from such an indisputable authority, a worker in the domain of physics who has done so much to make our glimpse into the nature of things more penetrating, every word must be received with attention. At first sight it seems startling to be told that far from the ether being a fantastic creation of the speculative philosopher, it is as essential to us as the air we breathe. When, however, we remember that on this earth we are not living on our own resources, that we are dependent from minute to minute upon what we are getting from the sun, and that the gifts of the sun are conveyed to us by the ether, all scepticism on the point of the necessity of its existence, whatever it may ultimately prove to be, must vanish. It is instructive to consider carefully this vast and vital function of the ether, for however hazy our ideas may be as to the real nature of the ether, it is good and certain information about it that it is a channel or agency by means of which energy can be transmitted. Without doubt, were it not for this vehicle the friendly forces of the sun would be lost to us, and with this loss springtime and harvest would disappear, and those great storehouses of energy—fuel, water-power, and food—out of which the whole work of the world is done, and on which alone it can go on, would fail us. In short, the physicist tells us that without ether there cannot be life, and if that be true he does not overstate the case when he says that ether is as essential to us as is the air we breathe.

What, then, is this ether which is so vital to our interests? We find Sir J. J. THOMSON himself asking, Is the ether dense or rare? Has it a structure? Is it at rest or in motion? The answers may be speculative but they are well reasoned. He put the case of light falling upon a body and being absorbed by it. If the body is free to move it is set in motion by the light and is, in fact, pushed forward in the direction in which light is travelling. The body gains momentum and something has lost it, which is the wave of light falling upon it, and hence there must have been momentum in the wave in the direction in which it travelled. Momentum implies mass in motion, and the conclusion is that in the ether through which the wave is moving there is a mass moving with the velocity of light. Calculations based on the pressure due to light show that in a cubic kilometre of ether, carrying light as intense as sunlight is at the surface of the earth, the mass moving is only about one fifty-millionth of a milligramme. But this only refers to the mass moved when the light passes through it; the vast majority of the ether is left undisturbed by the light. We may regard matter, Sir J. J. THOMSON said, as possessing a bird-cage kind of structure in which the volume of the ether disturbed by the wires when the structure is moved is infinitesimal in comparison with the volume enclosed by them. By two independent sets of calculations the density of the ether would appear to be about 2000 million times that of lead; but although, as Sir J. J. THOMSON was careful to add, the idea that we are immersed in a medium almost infinitely denser than lead might seem inconceivable, it is not so if we remember that in all probability matter is composed mainly of holes! And here we come to the place where recent scientific work is pointing to developments of the profoundest importance. The relation of the ether to the radio-activity of certain elements is of such remarkable interest that the door has necessarily been opened to some vast speculations. MENDELEEFF thought that he had found in his chemical conception of the ether an explanation of the remarkable phenomenon of radio-activity, which has given more impetus to both chemical and physical studies than has any other discovery. He assumed that radio-activity was merely the outcome of the power of an element to concentrate within itself the ether. Sir J. J. THOMSON in his profound address supports the "degradation" theory of RUTHERFORD and SODDY. The radio-active elements, these investigators hold, are not permanent, but are gradually breaking up into elements of lower atomic weight. Uranium, for example, is slowly breaking up, one of the products being radium, while radium breaks up into a radio-active gas called radium emanation, the emanation into another substance, and so on. The radiations are thus "a kind of swan's song emitted by the atoms when they pass from one form to another," and so "when a radium atom breaks up and an atom of emanation appears, the rays which constitute the radio-activity are produced." On this view, said Sir J. J. THOMSON, the atoms of the radio-active elements are not immortal, they perish after a life the average value of which ranges from thousands of millions of years in the case of uranium to a second or so in the case of the gaseous emanation from actinium. As is well known, radio-active substances are constantly giving out large quantities of heat, presumably at the expense of their potential energy, and it follows, says Sir J. J. THOMSON, that when these substances reach their final non-radio-active state their potential energy must be less than when they were radio-active. According to RUTHERFORD'S measurements, the energy emitted by one gramme of radium in the course of its degradation to non-radio-active forms is equal to the kinetic energy of a mass of 1-13th milligramme moving with the velocity of light. This energy Sir J. J. THOMSON computes as corresponding with a mass of 1-13th of a milligramme more of ether attached to it than when it has "degraded" into the non-radio-active form If, accordingly, this ether does not increase the weight of the radium the ratio of mass to weight for radium would be greater by about 1 part in 13,000 than for its non-radio-active products. The interesting question remains as to whether the radio-active substances will ultimately furnish the first case in which there is shown to be some differentiation in the action of gravity, a selective action upon mass as against weight, or *vice versâ*. If such anticipations are realised the chemical conception of the ether will linger in our minds only as an interesting suggestion in history.

The question may naturally be asked as to whether these profound chemico-physical studies possess anything more than a mere academic interest; will the ether help us in the treatment of human suffering? The question has already been answered, for are we not waiting now for an intelligible interpretation of the nature of the beneficent action of X rays and other radiations in the treatment of disease? The only interpretation possible must surely be based on our right comprehension of the ether, since without the ether there can be no radiations Medicine will recognise that valuable services have been rendered to her by physics and chemistry, especially during the last few years, and therefore it will welcome the progress of further researches, however technical they may be and however difficult it becomes to follow the significance of the results. We may employ agents in disease of which we know nothing but which we know do good, and we might just as well think of giving up their use as of abandoning the practical application of wireless telegraphy or of the telephone because we do not know exactly what electricity is. Medical men will be willing enough to coöperate with the physicist, to follow him in his abstruse work, and to make the application of that work as free from empiricism as they can. It would not seem to matter which special branch of science we study, for we agree with Sir J. J. THOMSON that the sum of knowledge is a diverging and not a converging series. There are no signs of finality in science, but the latest developments both in chemistry and physics connote such powers of application and demand such resources of reasoning that medical men, having their more special studies to master, must be content to take much upon trust.

Annotations.

"Ne quid nimis."

A WELCOME TAX.

THE French Government is about to impose a tax which will not only be welcomed by the tax-payers themselves, but will also be most agreeable to us in England, and, indeed, it is likely to be hailed with satisfaction in every part of the world. A tax which the tax-payer himself recognises to be to his own advantage and profit is a find that may well engender envy in the hearts of Ministers of Finance throughout the world. Then it has all the better claim to our attention that something similar may be attempted in all countries. By various laws and enactments the French Government has shown its jealous desire to maintain the unsurpassed reputation of French wines. There was a moment when all such hopes were wrecked by the phylloxera. Then imitation wines were thrown on to the market, and these injured the reputation for wholesomeness of natural wines. Now, however, pure wine is again produced in abundance and is cheaper than the wooden barrels or the glass bottles in which it is placed. There is consequently a great temptation to so mix and doctor these very cheap wines as to pass them off as expensive wines coming from some choice vineyards. A Bill has therefore been introduced making it illegal to label a bottle as, for instance, "Bordeaux," unless it really does come from a clearly defined district on the banks of the Garonne and within a certain distance of Bordeaux. Nor shall champagne be champagne unless it comes from the province of Champagne, and cognac must emanate from Cognac, burgundy from Burgundy. The execution of this decree could only be assured by functionaries of the State watching on the spot the exportation of these wines; yet, when once out of sight, there would be nothing to prevent dealers tampering with these wines. Discussing the matter a few days ago with wine-growers of the Lot-et-Garonne and the Gironde, M. Cochery, the Minister of Finance, had a happy idea; he suggested that the State should put a State stamp on every bottle. The wine-growers were overwhelmed with joy at this proposal, therefore M. Cochery quickly added that of course they would not object to paying a penny for each stamp. The grower cordially admitted that a measure which would prevent fraudulent imitations of their products was well worth a penny per bottle. As something like 140,000,000 bottles are sold per annum this tax should bring in £560,000, and no one will be better pleased than those who pay the pennies. In England and elsewhere we shall also be well pleased to have a Government guarantee that what we order is really provided. From the health point of view, obviously the first necessity is to know exactly what we consume, and there is no reason why a system of stamps should not be applied to a great variety of alimentary substances as testimony to their origin and wholesomeness, and, at least in regard to articles of luxury, as a means of raising revenue. Of course, the ordinary French wines which cost about 1½d. the bottle will not bear a penny stamp or seal. The ordinary wine is the food of the poor. To encourage its consumption all taxes have been removed; thus less spirit is drunk and consequently intemperance is not so frequent.[1] The wine-drinking populations are the most sober in Europe. In France itself, as elsewhere, the wines from celebrated vintages are expensive, and it would be well worth the consumer's while to pay a penny extra to have a guarantee that he is not giving a high price for a mere imitation. The tax in the form of a paper label or stamp on patent medicines is the nearest approach in England to the new tax proposed in France. But the English tax affords the consumer no guarantee whatsoever. There are many articles we eat and drink at our risk and peril. A stamp duty that would ensure purity would be doubly useful—to the revenue and to the consumer.

THE MEDICAL TREATMENT OF SCHOOL CHILDREN.

WE have received from Dr. Robert A. Lyster, the county medical officer of Hampshire, a long and important communication on the subject of the medical treatment of school children as affected by recent legislation. The social position of the parents varies greatly, and the children whose case presents the most difficulty are those whose parents cannot afford to provide the requisite treatment and who are not in such circumstances as to obtain relief under the usual interpretation of the existing Poor-law. The present tendency of local authorities is to attempt to deal with these cases either by making some arrangement with local hospitals or by providing school clinics. In Hampshire, however, for local reasons much of the work has been handed over to the Poor-law medical officers, who naturally feel that these cases do not come under the heading of ordinary illness such as is contemplated in a Poor-law medical officer's contract. Mr. Lockhart E. W. Stephens of Emsworth, Hampshire, accordingly wrote on the subject to the board of guardians of the Havant Union. The guardians laid the matter before the Local Government Board and received a reply stating (1) "that if the children do in fact need medical attendance, though not for acute illness, and the parents cannot obtain it, the relieving officer's order for the attendance of the district medical officer should not be refused;" and (2) "that if any children should be found to require operation [illegible] they (the Local Government [illegible] to approve of payments to the [illegible] special arrangements." Dr. Lyster points out that the phrase "operation or specialised attention" can hardly fail to include the treatment of adenoids, diseased conditions of the tonsils ringworm, defective vision, and other bodily defects of which boards of guardians do not generally take cognisance, and as the guardians now possess power to make "special arrangements" for the treatment of such cases there can be no necessity for the local education authority recommending them for gratuitous treatment in hospitals. In fact, this letter from the Local Government Board may provide a satisfactory solution of a debateable question.

SCIENCE AT THE SNOW-LINE: THE "ANGELO-MOSSO" INSTITUTE.

We have described the origin and foundation of the institution for nature-study on the Col d'Olen. We have now to report its success in this the second year of its existence—a success which must be specially gratifying to the professor of physiology at Turin, after whom, by right of paternity, it is called, and to the Dowager Queen Margherita who stood godmother at its christening. Taking the route so dear to the amateur alpinista from Alagna and Gressoney, you ascend from Riva Valdobbia by a bridle-path through forest, meadow, and rock to the Albergo Guglielmina, where, in view of Monte Rosa, you refresh the inner man for the renewal of your journey, when less than half an hour brings you by mid-day to the Mecca of your pilgrimage. At this stage you cannot do better than repeat the record of Dr. Umberto Foà—a name held, and held in honour, by more than one of the sub-alpine school—who tells us that on the 19th ult. he found the director, Dr. Alberto Agazzotti, and the students under him busily engaged each in his favourite branch of research, and all more than satisfied with their work, its conditions, and its provisional results. The students were seven in number, four of them Italians, two Germans, and one Swiss. Besides these there had been temporary students, the last of whom were two Belgian ladies, who had in a 25 days' sojourn made an exhaustive study of the flora of the Olen, preceded by other nature students, mainly German, to be followed by fresh arrivals expected by previous announcement. "The life of the institute," says Dr. Foà, "runs an austerely regular course. Each student attends alone, or with one or more companions, at the experiments in the ample, well-equipped laboratories, or in the open, till the not unwelcome sound of the horn brings all to luncheon at 12 and to dinner at 7. These repasts, served at the 'tavola commune,' are prepared by the cook of the institute, who for eight months of the year acts as mistress in an elementary school in Lombardy, and for the two months of residence on the Olen ministers to the refection of the students." Her post, not an easy one to fill, requires her to arrange with the director for the wants of some ten or a dozen exacting stomachs, for whom every day there mount from Alagna the mules laden with meat, vegetables, eggs, milk, and other necessaries, all of which must arrive in good time. But the trying part of her *métier* is the special diet which Dr. A., for instance, whose *menu* consists of rice, potatoes, cheese, and marmalade in view of his personal studies in metabolism, cannot do without; or that of Dr. B., who solves the problem of existence on milk and eggs, taken every three hours. And then there is the commissariat of the laboratory—also to be conveyed to more than 9000 feet above sea-level—such as the rabbits, indispensable to the physiologist, thanks to which (says Dr. Foà) so many useful findings are reached and so many prizes in the shape of monographs are won. At the site of the "rabbit warren" attached to the institute stands the last pole for the telephone service which will connect the Olen immediately with Alagna and mediately with Italy and the outlying world. The opening of this communication with their fellow-men has been hailed with joy by the students, on some of whom the isolation was beginning to tell, and for all of whom it means improved facilities for work. Not that their lives are entirely sedentary. Excursions in the immediate neighbourhood are frequent, reinforced by outsiders. Professor Galeotti of Naples on some of these studied the bacterial flora of the surrounding peaks according to their exposure, besides gathering many specimens on the contiguous rocks. Having brought their experiments on the Olen to an end, the students may supplement them at the "Capanna Margherita"—Queen Margaret's Cabin—fitted up with a physical, a physiological, and a meteorological laboratory. The temperature at the institute, cold in July, becomes milder in August, and returns to cold in September, when the work is suspended for the year, and the tenement is abandoned to the snow under which it lies buried for nine months. Not that it suffers during that interval. Its structure and all its appointments, internal as well as external, are built and framed to withstand the elements—even at more than 9000 feet. The scientific instruments, for example, by the dryness of the air are always found, on the resumption of residence, in excellent condition—much better (according to Dr. Foà) than those in the city laboratories, so that further contributions to the scientific equipment may be made without fear of their being damaged—a consideration which Dr. Foà emphasises in appealing to the world of science and education for fresh acquisitions to the armamentarium. This appeal he strengthens by drawing attention to the published literature of the institute, embodying excellent work, two volumes of which, under the title of "Archivio del Monte Rosa," have already appeared from the firm of Messrs. Treves of Milan, while a third, of still greater value, will shortly see the light—to the credit and advancement of nature-study, Italian and foreign. We cordially say "ditto" to this appeal in the hope that it may receive the desired response not only from the nationalities conterminous with Italy but from others farther afield, including those of the English-speaking world.

SOME INDIGENOUS INDIAN DRUGS.

We have received from India a copy of the second report of the Indigenous Drugs Committee. It contains records of observations made by various officers in India on 12 drugs. The first of these is podophyllum emodi, the resin of which was employed. There was a general consensus of opinion that this drug is a very useful cholagogue purgative, quite equal in value to the resin from American sources. The plant grows in the forests of the Himalayas from Chitral to Sikkim. Experiments have been carried out by the Forest Department in artificially propagating it with fair success. It was formerly stated that the Indian resin had only half the strength of the American, but further analyses seem to show that this is incorrect and that the Indian resin is quite as powerful, while the root contains more of it than the American variety. The next drug investigated was alstonia scholaris, of which a tincture was used. The natives of India use it in fevers and dysentery, and have considerable faith in its action. The observations of the committee are inconclusive but are not encouraging, most reports describing it as inferior to quinine. Picrorhiza kurroa is also extensively used in India under the name of *kutki.* The committee believes it to be useful as a bitter tonic, but the reports received on it were insufficient to warrant any very definite conclusions in regard to its usefulness. Adhatoda vasica appears to be a useful expectorant with actions similar to those of ipecacuanha. In regard to acacia catechu and Cæsalpinia bonducella no reports were received, except a note in regard to the standard of purity of the former, the use of which the committee regarded as not needing demonstration. Calotropis procera and gigantea are used in place of ipecacuanha in the treatment of dysentery. The committee obtained conflicting reports as to their efficacy. In regard to ipomœa hederacea, it appears to be an effective hydragogue purgative and to be useful as a substitute for jalap. Andrographis paniculata appears to be a mild bitter, and to be useful instead of chiretta, but it is inferior to quinine. Embelia ribes used as a vermifuge was only tried in one case, in which it failed. Rheum emodi was found to be unsatisfactory as a purgative. Cassia montana, leaves of which have appeared in the London market as senna, was found to be quite unsatisfactory. The responses received by the committee to its request for reports on the trial of the various drugs do not appear to have been very numerous, and some of those sent in are, as the committee points out, practically useless In spite of these handicaps the report is an interesting one and brings out some useful information.

MOTOR DUST.

IMPROVEMENTS in the construction of motor vehicles have done much to diminish the noise and vibration which they cause, but the nuisance due to the clouds of dust which mark their progress shows no sign of abatement. On the country roads the throwing up of dust is a serious annoyance to other users of the roads, and the occupiers of houses which overlook the public highway are only too well aware of its harmful effect on their property. In Hertfordshire, where many roads are thronged with motorists owing to the proximity of the metropolis, Mr. F. E. Fremantle, the county medical officer of health has expressed the opinion that this dust is a distinct menace to the health of those who are much exposed to it. In his annual report to the county council, after an allusion to the well-known dangers incidental to workers in dusty trades, he points out that road dust contains not only angular gritty particles capable of mechanically irritating the air passages, but also offensive organic matter in a state of extremely fine division The possibilities of contagious and septic diseases being propagated in this way are deserving of careful attention on the part of sanitarians.

FORMALDEHYDE POISONING.

THOUGH formaldehyde in the form of a 35 to 40 per cent. solution (formalin) is much used, cases of poisoning by it are very rare Formalin poisoning is not mentioned in Dr. William Murrell's excellent little book, "What to do in Cases of Poisoning." Probably its pungent odour prevents it from being taken internally either by accident or for suicidal purposes. However, a few cases of poisoning have been recorded in foreign medical literature. I[illegible] by Dr. L. A. Levison in the *Journal of* [illegible] *Association* of June 4th, 1904, p. 1492, between two and three ounces of commercial formaldehyde were swallowed and death in collapse occurred 20 minutes later. At the necropsy the mucosa of the lower part of the œsophagus, the stomach, and the first part of the duodenum were found of a dark chocolate-brown colour and of the consistence of leather. In the same journal of date April 3rd, 1909, Dr. A. J. Bower reported the following case. A girl, aged 20 years, swallowed about half an ounce of formalin. When seen about 20 minutes later she was sitting up and did not complain of pain. Lavage of the stomach was performed and there was a strong odour of formaldehyde in the fluid which first returned. The pulse was 106 and good. After removal of the tube the patient fell to the floor in a condition of collapse with pallor, irregular pulse, and coldness of the surface. Strychnine was given. After several minutes consciousness was partially regained and she complained for the first time of pain in the throat and paroxysmal pain in the stomach. She vomited twice; the vomit was small in amount and contained blood. Demulcents—milk and the white of eggs—were administered and an ounce of castor oil was given (both for its demulcent and cathartic effects) About six ounces of lime-water were administered every two hours alternately with a glassful of water containing a drachm of sodium bicarbonate. The patient remained in a stuporous condition for about 30 hours, during which she could not speak but could understand conversation, the muscles of the mouth making laboured but fruitless movements. The tongue was reddened and swollen and could not be protruded. The eyes were opened with difficulty. After 36 hours she could talk slowly and with difficulty. On being questioned she said that only in the throat had she suffered from constant pain and that this was not severe. At intervals there had been pain in the œsophagus and stomach which did not last long and was severe only at first. Further recovery was rapid; she was able to get up in four days. A specimen of urine obtained 30 hours after taking the poison contained a heavy sediment of amorphous and triple phosphates but no albumin. We may refer to a similar case, presenting, however, some different symptoms, recorded by A. Gerlach.[1] A girl, aged 21 years, drank between two and two and a half ounces of formalin. She rapidly became unconscious and the temperature rose to 100° F., and she vomited a small quantity of material with the odour of formalin. The stomach was irrigated. The unconsciousness lasted 19 hours, during which the urine was suppressed, and there was diarrhœa. Later she passed dark turbid urine containing a trace of albumin and formic acid. Ammonia, in the form of the liquor well diluted or of liquor ammonii acetatis, has been recommended as an antidote for formaldehyde, with which it combines, forming urotropine.

CRUDE AND CORRECTED DEATH-RATES.

THE Registrar-General in his recently issued quarterly return, relating to the second quarter of this year, again calls attention to the necessity for correcting crude death-rates, for differences of sex and age constitution in the several populations, before it be sought to compare the rates of mortality in different areas with a view to testing comparative local health conditions The mean death-rate in the whole of England and Wales during the three months ending with June last was equal to 14·0 per 1000, and was 1·3, or 9 per cent., below the mean rate in the ten preceding corresponding quarters. In the 76 largest English towns, having at the last census populations exceeding 50,000, the crude death-rate last quarter did [illegible]·9 per 1000, and was slightly below the general [illegible] but after correction for difference in sex and age constitution the truer rate for comparison is raised to 14·7, showing an excess of 0·7 upon the rate in the whole of England and Wales. In 143 smaller English towns, which [illegible] 50,000, [illegible]·3 per 1000, which is raised, however, to 13·9 by correction for sex and age constitution. In the mainly rural population of the remainder of England and Wales, exclusive of the 219 large towns, which had in 1901 populations exceeding 20,000, the crude mean death-rate was equal to 14·5 per 1000; this rate, however, when corrected for sex and age constitution is reduced to 13·6 per 1000. Thus while the crude death-rates show an excess of 0·6 per 1000 in the rural death-rate compared with the rate in the 76 largest towns, correction for sex and age constitution shows that the true death-rate in the 76 large towns exceeded the true death-rate in the mainly rural population of England and Wales by 1·1 per 1000, an excess equal to 8 per cent. The sex and age constitution of urban populations is invariably, although to a variable extent, conducive to lower death-rates than the sex and age constitution of rural populations, owing to the relatively large proportion of young adults in town populations, among whom a low death-rate naturally prevails. Thus the crude death-rate last quarter understated the true death-rate in the largest towns by 6 per cent., and in the smaller towns by 5 per cent.; while, on the other hand, the crude death-rate in the remaining and mainly rural population of England and Wales overstated the corrected and truer death-rate by 6 per cent. The necessity for this correction, before comparing rates of mortality in different areas, is thus sufficiently obvious.

THE BLACK SPOTS ON CHILLED BEEF.

Dr. E. Klein has recently published a report on behalf of the Frozen Meat Trade Association on "The Nature of Black Spots on Chilled Beef." It appears that the beef shipped to this country from the Argentine occasionally develops circular black spots which are present, either isolated or in groups, on the lower or thin parts in the fascia, in the fatty portion of the thick parts, and in the fat belonging to the inner surface of the flanks. According to Dr. Klein's observations, the spots are due to a mycelium belonging to a fungus of the nature of an oidium which he proposes to call "oidium carnis." It forms oval gonidia either by short lateral branches of the free hyphæ or along and at the ends of the superficial threads in the fat tissue. The oval gonidia are capable of multiplying in the manner of yeast cells. *The most important conclusion of all is that, according to Dr. Klein, the material of the "black spots" is harmless to the animal body, a view which is confirmed by direct animal experiment.* This is not surprising since the growth belongs to the oidium kind of moulds which are not capable of growing at the temperature of the animal body. Lastly, the presence of the mycelium, he states, does not in any way alter the normal character of the tissue elements themselves, either those amongst which the mycelium is situated or those beyond its extension. It is to be feared, however, that it is the appearance of the thing which counts, although there are other foods which are only appreciated by certain people when moulds are present.

FRACTURE OF THE ANTERIOR SUPERIOR SPINE OF THE ILIUM.

IN the *Cleveland Medical Journal* for August Dr. J. H. McHenry has reported a case of fracture of the anterior superior spine of the ilium and reviewed the literature of the subject. A youth, aged 17 years, ran and won a race; directly afterwards he stopped suddenly as he felt "something give way" in his right side, causing a sharp pain. On attempting to walk he could not move his right leg and he had to be carried home. On examination he was found to be well nourished and muscular. He could not stand, and lay with his right foot turned inwards. He could turn the foot from side to side, but could not lift the heel from the bed. When Dr. McHenry attempted to elevate the limb the patient complained of pain over the right anterior superior spine of the ilium. Here slight swelling, tenderness, and crepitation were found. Distinct crepitus was elicited on raising the limb or flexing the knee, and a loose bony fragment could be felt. The fragment was freely moveable up and down when the limb was flexed and rotated inwards, but less moveable when the limb was extended and rotated outwards. Radiography showed a fracture of the anterior superior spine of the ilium, the fragment being 3½ centimetres long and displaced downwards and inwards. The limb was bandaged from the ankle to the groin in order to immobilise all the muscles. The fragment was replaced as nearly as possible in its normal position by manipulation of the limb and held in place by a gauze pad, over which were placed strapping and a spica bandage. The limb was flexed at the hip and knee and secured on a double inclined posterior splint. On the twelfth day the pad was removed. Callus and firm bony union were found and there was no pain or tenderness. The pad was reapplied under a spica bandage. After 16 days the pad was removed and the limb was gradually extended. Massage was applied daily. On the eighteenth day the splint was removed and the patient was allowed about on crutches. On the twenty-second day radiography showed complete bony union and the fragment displaced downwards half a centimetre. The patient was able to get about on crutches, which he discarded in a few days for a cane. Recovery rapidly became complete. Many muscles —the sartorius, tensor vaginæ femoris, external oblique, internal oblique, transversalis, and iliacus—are attached to the anterior superior spine of the ilium, but fracture from muscular violence is rare. Dr. McHenry has found only nine cases in medical literature. All occurred at the ages of 17 or 18 years, except one at the age of 70. Several occurred while running. As the epiphysis of this spine does not unite with the body of the bone until the twentieth to the twenty-fifth year these accidents may be regarded as separations of epiphyses.

THE FOURTEENTH ANNUAL REPORT OF THE EGYPTIAN GOVERNMENT HOSPITAL FOR THE INSANE FOR 1908.

UNTIL a quarter of a century ago the Egyptian Government, apparently with the sanction of its medical advisers, kept 300 lunatics in a pitiable state, often without clothes, and always without adequate food or air. The excited patients, chained like convicts, occasionally had their heads held under running water, which was the only medical treatment vouchsafed to them, while the melancholics sat huddled all day on verminous mattresses in rooms never visited by daylight. With unconscious irony the only medical attendant provided to care for the insane was a veterinary surgeon! To-day they are housed in the same buildings, but everything else has been transformed. No longer regarded as a penal institution from which but few ever emerged, many families are now willing to send their afflicted relatives to be treated, and a few ex-patients voluntarily return every year to the asylum, preferring the care and discipline of Dr. J. Warnock and Dr. H. W. Dudgeon in the Egyptian Government Hospital for the Insane to the jibes and ill-treatment of their own homes. As a consequence, we learn from the fourteenth annual report of that institution that the number of certified lunatics in the country is no longer remarkably small, and that the bed accommodation of the asylum has been gradually raised to 877, and will shortly become 1100 when the whole of the additions now in contemplation are finished. Yet overcrowding is inevitable, and the number of inmates on the last day of the year was 140 in excess of the establishment, though no less than 266 uncured cases were discharged during the year, most of them for lack of room. Progress continues to be made with the new asylum at Khanka, where it is intended to form an agricultural settlement, beginning with 300 chronic mild cases. Of the 561 patients admitted during the year 36 were due to hashish (cannabis indica), nearly all being men from Cairo, Alexandria, and Suez; this is, however, a considerable reduction on previous years, and seems to show that the efforts of the

coastg [illegible]
the sch [illegible]
in vain. The police, too, deserve credit for unwonted zeal, for they caused nearly 2000 hashish dens to be definitely closed, besides others which were closed for a month or merely fined. The general public still believe that a lunatic is only suffering from the divine wrath, and that it is unnecessary to take steps to control an excitable individual, even when they have given a written guarantee to the asylum authorities that they have the necessary means and will to watch the patient. As instances of the disastrous results of acceding to the demands of friends who insist on the discharge of dangerous patients, Dr. Warnock gives six cases which have come to his knowledge, all having been discharged since June, 1906—three committed suicide, one killed his wife, another broke his father's ribs, while the sixth was re-admitted to the asylum charged with burglary. 35 patients were admitted suffering from alcoholic insanity and 33 from general paralysis; 24 of the latter class proved to have syphilitic histories, and it may be generally stated that general paralytics in Egypt are mostly dwellers in towns, with a history of both syphilis and alcohol, and that they furnish one quarter of the deaths on the male side in the asylum. No less than 134 patients, or nearly 24 per cent., admitted during the year were found to be suffering from pellagra, though only 88 of these were classed as pellagrous insanity, the remainder suffering from some other form of mental disease accidentally associated with pellagra. The hypodermic treatment of pellagra by atoxyl, which has been highly praised by observers in Roumania, was tried on 158 cases, the treatment of each individual extending over one month, but there was no greater amelioration than in a similar number of cases treated during the preceding year without atoxyl. Though the drug seems to be useful in banishing the pellagrous rash of acute cases, atoxyl, both in Egypt and in some of the Southern States of America, has so far not proved to be as useful in the treatment of advanced stages of the disease, which are mostly met with in asylums, as the medical accounts from Roumania led workers to hope. This excellent report concludes with a temperature chart showing how the necessary seclusion of excited cases varies in direct ratio with the heat of the weather. The accidents of the year were mostly due to the violent conduct of the acutely insane and to epileptic fits; many attempts at suicide occurred but none were successful. On one occasion precipitation from a tree was frustrated by the chief of the asylum fire brigade, who cleverly passed a rope round the patient before she fell and thus saved her life, earning for himself a special pecuniary reward. Several attendants were severely handled by patients, and one female attendant lost a finger through being bitten by one of her charges.

THE SERUM-DIAGNOSIS OF HYDATID DISEASE.

THE study of the formation of antibodies within the animal organism has not only given rise to new methods of treatment in regard to bacterial diseases, but has also led to new methods of diagnosis. The same principle has been applied to the diagnosis of diseases produced by parasites of animal origin, and an interesting example of this, which promises to be of real practical value in man, is afforded in a paper published by Dr. Weinberg,[1] as a result of work in Professor Metchnikoff's laboratory on the serum-diagnosis of echinococcal disease. The first to apply this principle in this condition was Dr. Guedini, who, in 1906, succeeded in establishing the presence of specific antibodies in the serum of three persons suffering from hydatids by means of the method of Bordet-Gengou. Dr. Weinberg, in collaboration 50 per cent., which they explained by the fact that they were unable to obtain a pure antigen and were obliged to employ an extract of the parasite for this purpose. On investigating hydatid disease in sheep and using the hydatid fluid as the antigen, they invariably obtained positive results. Working with M. Vieillard, Dr. Weinberg obtained similar results in hydatid disease in the camel. The process employed is based on the phenomenon of Bordet-Gengou, which consists in the fixation of complement by the mixture of the specific serum with the antigen. This fixation of complement is indicated by using sensitised red corpuscles, which remain intact when the serum of the patient contains specific antibodies for hydatid, but suffer a rapid hæmolysis when this is not the case For the test the following substances are necessary: the patient's serum, the antigen (hydatid fluid) complement from a guinea-pig, sheep's red corpuscles, and hæmolytic serum for these corpuscles—i e., anti-sheep's corpuscle serum Two methods of applying the reaction are described—a rapid and a slow. In the former the test is tried with fresh unheated serum, and the guinea-pig's complement is therefore not necessary, but careful controls must be done. Unfortunately, it does not give certain results, and if it is negative it is necessary to employ the slow method. For this two preliminary experiments are necessary—the first being to titrate the guinea-pig's complement; the second to establish whether the antigen and the serums employed, those of the patient and of the control, do not themselves fix the guinea-pig's complement Having established these points various mixtures of normal saline solution, the patient's heated serum, the guinea-pig's complement and the antigen (hydatid fluid) are made, put in the incubator at 37° C for one hour, and then the sensitised red corpuscles are added. After a further half an hour in the incubator the tubes are examined. In order to be certain of the result the hæmolysis must be completely prevented. As a result of observations on 52 cases Dr. Weinberg concludes that the view put forward by Dr. Guedini that the serum of patients with echinococcal disease contains specific antibodies is established. In 27 of these 52 cases the diagnosis of hydatid disease was proved by operation, and in 26 of these the reaction obtained was positive. In one case a negative result was obtained before operation, while a positive reaction was established 20 days afterwards. This Dr. Weinberg suggests as possibly due to the absorption of hydatid fluid during the operation, with a subsequent formation of antibodies The suppuration of the cyst or the production of the death of the cyst by the influx of bile does not prevent the formation of antibodies or hinder the reaction. He gives interesting details of some cases in which the clinical signs were suggestive of echinococcal disease, but in which the serum reaction was negative, where subsequent operation proved the absence of hydatids. The serum reaction proved to be much more trustworthy as an index of the presence of hydatid than the occurrence of eosinophilia. No specific antibodies were found in the urine or in ascitic fluid from cases of hydatid disease. Dr. Weinberg also carried out some experiments with a view of determining how long after operation the specific antibodies elaborated by the organism remained in the serum. He investigated 26 cases at intervals after operation varying from 11 days to 12 years, and in 16 of these he obtained positive results. On the other hand, he has found that in every case where the cyst can be removed entire with its sheaths and without incision the antibodies rapidly disappear from the serum. The question is obviously of importance in regard to reinfection, and in order to determine this in cases giving a positive reaction after operation, Dr. Weinberg suggests the construction of two curves—one showing the course of the eosinophilia, the other the richness of the serum in specific antibodies—in order to observe whether they gradually diminish. Dr. Weinberg's paper is an important addition to our knowledge of hydatid disease, and the method of diagnosis he has established seems likely to be one of great value. He points out that it is more trustworthy than the Wassermann reaction for syphilis, because in the hydatid fluid there is available an absolutely pure antigen. He states that this can be preserved on ice or in the dry state, so that it can be always available. He has also studied the precipitin method of diagnosis employed by Fleig and Lisbonne, but has found it less trustworthy, since it was only obtained in one-third of the cases. He is to be congratulated upon the thorough manner in which he has investigated the question, and his method, if confirmed by other investigators, should eventually become almost a routine procedure in the diagnosis of hydatid disease.

HÆMORRHAGIC DIPHTHERIA.

Now that the great majority of all cases of infectious disease are isolated in special hospitals we have to depend for advances in our knowledge of them upon the medical officers of the Metropolitan Asylums Board and other similar institutions. We are glad to find that these officers have not only inclination but also facilities for scientific work. An example may be seen in the interesting paper on Hæmorrhagic Diphtheria contributed by Dr. J. D. Rolleston to the Metropolitan Asylums Board Report for 1908, in which statistics are given based on 78 cases of this condition among 1550 cases of diphtheria. From the figures given it appears that the hæmorrhagic form of the disease occurs from year to year with curious regularity, the percentage of such cases being usually between 5 and 6. The incidence is not influenced by the season of the year or by the age or sex of the sufferer, and it does not appear that previous ill-health is a cause of the malignancy of the disease. Along with the hæmorrhages there were invariably present other signs of grave infection, such as extensive membrane, "faucial and palatal œdema, disproportionate adenopathy, pitting of the skin over the glandular swelling, and absence of, or delay in, reaction to antitoxin." The mortality of these hæmorrhagic cases reached 83·3 per cent. Grave as is this figure, it yet has a hopeful aspect, for in days gone by practically all these patients died. The saving of nearly 17 per cent. of the lives is probably due to treatment with antitoxin, the relationship of which to this affection is of considerable interest. It would seem from Dr. Rolleston's observations that early administration of large doses of this remedy has the power of preventing, or at least modifying, the onset of hæmorrhagic symptoms. Thus no cases of this nature occurred among patients who were treated with antitoxin on the first day of the disease, but the percentage steadily rose as the delay in the administration of the serum increased. Further, while among 23 cases in which less than 33,000 units of antitoxin were given none recovered, among 55 who received this and larger quantities 12 finally survived. All those who recovered went through an attack of paralysis. This seems to suggest that there may be one and the same poison at work in the production of hæmorrhage and of the neural lesion. We hope that Dr. Rolleston will pursue his researches into the pathology of the condition, which needs careful elucidation. Is there a mixed infection in these cases? Is there any particular strain of diphtheria bacillus which causes this complication? Are there any special morbid lesions of the various viscera which accompany it? Seeing the close connexion that sometimes exists between hæmolysis and hæmorrhage, as in the case of snake venom, it might be interesting to examine the serum for hæmolytic substances. These and other problems still await solution and may be commended to the attention of the skilled observers in our fever hospitals. The light thrown by statistics on this and kindred questions is of great importance, but will not by itself suffice to determine the nature of the malady.

THE RECENT WORK OF THE GOVERNMENT LABORATORY.

The official report of the principal chemist (Sir Thomas E. Thorpe) of the Government laboratory for the year ended March 31st, 1909, has been issued. Sir Thomas Thorpe may be congratulated upon the completion this year of 15 years' service, during which the work and equipment of the laboratory have been extended considerably. The report, which will be the last one from his pen, shows that the number of samples examined has increased by about 100,000 and the staff by 27. The increase in the number of samples has been due principally to a greater activity in the Excise department, 117,379 samples having been examined last year as against 46,375 in 1894. The number of samples of food and drugs referred to the Government laboratory during the past official year was 120. Of these samples the Government analysts agreed with the public analysts' certificate in regard to 100. 82 of the referred samples were of milk, and 12 were of butter. Amongst miscellaneous samples appears a case of fish poisoning. The river Lemon, which is within the jurisdiction of the Teign Board of Conservators, proved to be contaminated with copper, the source of which was mine drainage. Dead trout taken from a spot near the source of pollution contained copper. The metal was found in the matter washed from the gills, in the viscera, and in other parts of the body of the fishes. Samples of the river water on standing deposited a sediment containing copper. In some analytical work undertaken at the instance of the recent Royal Commission on Whisky Sir Thomas Thorpe reports that the whisky sold at fairs and markets, public-house and refreshment bars was free from any deleterious ingredients such as methylated spirit, vitriol or other mineral acids, or salt, which have been alleged to be used for adulterating whisky of this kind. Most of the samples, he adds, consisted mainly of patent-still spirits, but the prices at which they were sold corresponded generally to the character of the mixture, and as a rule were not excessive. In regard to materials used in the making of beer, 559 samples were examined, of which 30 proved to contain over $\frac{1}{100}$th grain of arsenious acid per pound in the case of solids or per gallon in the case of liquids. Of 114 samples of malt examined only one exceeded the limit, while none exceeded the limit when 278 samples of glucose were examined. 4347 samples of beer were taken from the premises of 1591 publicans and retailers of beer, and 8·1 per cent. of these were found to be diluted with water, five were adulterated by the addition of "saccharin," and three by the addition of a "heading" solution. In considering these quite few facts, which are scattered amongst a great number of others in the report, it is obvious how very important to the community this Government department of control has become.

A telegram from the Governor of Hong-Kong to the Secretary of State for the Colonies, received on August 28th, declared Hong-Kong to be free from plague.

The Earl of Crewe, Secretary of State for the Colonies, has appointed a scientific committee for the study of entomology in relation to the propagation of diseases in man and animals and to the cultivation of plants in the Colonies and Protectorates of British Tropical Africa. This committee, which will have the title of the African Entomological Research Committee, and will be under the chairmanship of the Earl of Cromer, has a distinguished scientific constitution. The committee will publish its results in journal form.

DOMICILIARY MEDICAL TREATMENT UNDER THE POOR-LAW.

BY MAJOR GREENWOOD, M.D. BRUX., LL.B LOND., D.P.H.,
BARRISTER-AT-LAW; HONORARY SECRETARY, POOR LAW MEDICAL OFFICERS' ASSOCIATION OF ENGLAND AND WALES.

I.—MAJORITY REPORT.

To the critic of the Medical Relief proposals of the Majority Commissioners one thing is apparent, which must be greeted with approval by all practical Poor-law reformers. *The necessity of a Destitution Authority is frankly admitted*, and that in my opinion raises the value of their proposals far above those of the Minority. Regarded closely, the general scheme of the Majority does not tend to do away with all the foundations on which for more than two centuries the English Poor-law has been slowly and laboriously constructed; and although there *seems* to be some grounds for censuring the fantastical manner in which exception has been taken to many old Poor-law terms—an error which the Minority have not failed to make the most of—those wishing to see practical reform in our present Poor-law system without parting with all the land-marks of the past, will be inclined to smile at this weakness, and to welcome as far as they can the efforts to reform much which calls out loudly for reform.

[illegible] s to the creation of new [illegible] the country, are not so [illegible] ght appear, and do not [illegible] of the medical pro- [illegible] present powers of the guardians might be readily transferred; and the system of [illegible] o tend to prevent the new [illegible] the abuses which disgrace [illegible] wn might be modified in [illegible] of the [illegible] e needs [illegible] recom- [illegible] I think [illegible] would be in agreement. It is only when we come to the proposal to base Poor-law medical relief on a system of pseudo-provident dispensaries that our sympathy becomes alienated, and that some of us are tempted to look with pre[illegible] the scheme of the Minority; and on account of [illegible] ently better treatment proffered to us as a public [illegible] shut our eyes to the not unlikely ruinous changes that would be brought upon our common profession by the abolition of the Destitution Authority and the general break-up of the Poor-law, as foreshadowed in their sweeping and revolu[illegible] In fact, we part comp[illegible] [illegible] ortion of the Majority [illegible] Hill and Dr. Arthur [illegible] and we do so because these Commissioners seem to [illegible] doing what they profess to be opposed to, and to [illegible] tically bringing about what they give excellent reasons fo[illegible] not doing.

I will instance two principles which they clearly lay down, to my mind, quite inconsistent with the provident dispensary scheme they propo[illegible] (1) The necessity for having a better sys[illegible] and (2) that on no [illegible] made *general*.

1. In Part V., Chap. 2, Par. 127, we read:—

> The *primary responsibility* of the Public Assistance Authorities for adequate inspection and supervision of the medical relief arrangements should, *we think*, be clearly recognised and carefully maintained.

From this paragraph we see *that not only* is a better system of inspection in the new Poor-law scheme to be maintained by the Destitution Authority, but [illegible] through the appointment of more [illegible] of the [illegible] endeavour made to compare it with [illegible] what might be expected under the new, it seems to me that the present system offers many advantages over the one proposed. It may be true that there is little or no inspection *of Poor-law medical relief at the present time; but it is not true that it is due to any fault in the present system, which presents facilities for an efficient inspection superior to any that could be hoped for from a provident dispensary system.*

Every district medical officer at the present time keeps a large and compendious medical register, in which it is his duty to inscribe every consultation he has with, and every visit he makes to, a Poor-law patient. In addition, he is required to record his prescriptions and general treatment, with the result of the same in a special column. If this is *properly done, as it should be, it is difficult to see how a* better means for testing Poor-law medical relief could be *furnished. If the authorities do not trouble to inspect these* records [illegible] medical [illegible] properly done, but it cannot be denied that there now exists an excellent machinery for doing it. It can scarcely be argued that the proposed dispensary system offers no obstacles to the adoption of the same method. Under any system such as that proposed the main principle is that no distinction is to be made in the treatment of the patients at these dispensaries. All must be treated alike, and what is done in the case of one patient must be done for another. If only State patients are to have records of their treatment entered for inspection it is clear that a different scale of payment must be adopted for State patients. If all are to be treated alike a new scale of fees will have to be paid, having little relation with the present payments of provident dispensar[illegible] If the idea in the minds [illegible] *ation of a series of self-* [illegible] where the majority of the patients are not State patients, it would have been thought by most people that the State minority would rank *pari passu* with the other patients, and that records of their cases would be kept in a similar manner. In that case, away would go all the elaborate reports that are now required in the case of Poor-law patients, and proper inspection would become impossible. If only State patients are to have registers allotted them like the present, the fees for their attendance will have to be increased, and competition will arise among the dispensary d[illegible] as poss[illegible] and if [illegible] an equal claim to State patients a multiplication of registers will be necessary that will not make an adequate inspection easier. From whichever point of view we regard it, it seems clear that a special service for State patients is clearly indicated.

Whenever a provident dispensary has been successful, if [illegible] it will be found that it [illegible] type of out-patient [illegible] se institutions no attempt has hitherto been made to record the cases in the way directed by the Poor-law Orders for obvious reasons. The record required by the Poor-law Orders is essentially for *Poor-law* reasons; in the case of the general hospitals it is for *medical reasons*; that is, a record is required only for [illegible] comparatively small [illegible] the medical interest, [illegible] cessity of an accurate [illegible] the State is quite as [illegible] medical cases as others, and [illegible] wn for doing this work is [illegible] the matter is examined in detail the more the necessity appears of treating State patients apart from others.

[illegible] inspection of the treatment of State [illegible] ated for another reason. A member of [illegible] patient can protect himself by changing his doctor. So that [illegible] permission given to the State patient to change his doctor [illegible] same level in this [illegible] other patients, [illegible] by [illegible] ing a [illegible] is a [illegible] other [illegible] the responsib[illegible] be unable to divest himself of. As a result, the State patient would get less protection and guarantee against neglect than he possesses at the present time. The getting rid of a lay intermediary between the State patient and doctor is another bar to adequate inspection. Evidence is given in the Report of numerous cases where the district medical officer does not trouble to report Poor-law cases to the Destitution Authority but absolves himself from that responsibility by treating them as private patients. *According to the estimate of a competent medical* inspector, this sometimes takes place to the extent of 20 per cent. of all the Poor-law cases. Where a lay officer intervenes it cannot occur, but where the applicants go straight to the doctor he can make them State patients or not, to suit his own convenience. For affording, then, a good and efficient machinery for adequate inspection of Poor-law medical relief the Provident Dispensary scheme of the Majority Commissioners is inferior to the present system.

2. At the commencement of this article attention was drawn to important points in which—in the writer's opinion—the principles laid down for the reform of the present Poor-law system by the Majority Commissioners were superior to those of the Minority. Certain principles were enunciated, as to the soundness of which, it would have been thought, there could be little difference of opinion. The objection to a general gratuitous treatment for a large portion of the community was clearly stated, and the evils likely to arise from such a system plainly pointed out. In such circumstances it seems the more surprising that the Majority Commissioners do not appear to see that some of the most probable results of their provident dispensary scheme would be to bring about what they condemn. In many respects, indeed, the medical relief they propose to administer would be scarcely less likely to be abused than that proposed by the Minority Commissioners. If we carefully read paragraph 186 of Part V.:—

> We therefore recommend that medical assistance be more readily accessible to *all* who are in need of it—

what is to be understood? Do we not see here a recommendation almost identical with that of the Minority Commissioners? It is consistent according to their principles but very perplexing when voiced by the Majority Commissioners. Contrast the above with paragraph 201:—

> The first objection to a gratuitous system of medical assistance is that it would be impossible to confine it to the very poor or even to the poor, &c.
>
> We are faced with the fact that the improvements in indoor medical relief have in 16 years doubled the number of ordinary able-bodied inmates who come for indoor relief in sickness, &c.

How could "medical assistance be more readily accessible to *all in need of it*" without shutting the eyes to the pregnant warning contained in these passages? It is true we read in paragraph 236—

> Medical assistance would be available for all; the rich and the well-to-do, if they took it, *would have to pay for it.*

But is not this the "clear and consistent code" of "chargeability" of the Minority Commissioners once again? Is it not in reality the granting of a gratuitous general medical assistance with the hope that the evils almost certain to be engendered thereby will be mitigated by the recovery of charges from those who have abused the credulity of the State? The fallacious nature of such an expectation is well known to all practical statesmen and is closely connected with the vulgar notion that anything may be done by an Act of Parliament.

Then, as to the increase of indoor relief in 16 years, with the present deterrent methods, does not this inculcate a lesson? If practical experience proves this in the case of indoor medical relief, what is to be expected in the case of outdoor medical relief without any of the deterrent methods? Again, the Majority criticism of deterrents does not seem much sounder than that of the Minority. If we accept the principle that general gratuitous medical assistance is not to be granted some form of deterrence is absolutely necessary, and in my opinion it would pass the wit of man to enunciate a sounder principle than that advised by the Royal Commission of 1834, the gist of which was that the lot of the State supported should not be made better than that of the class above. This would seem to many economists an obvious truism. No doubt deterrents may be of many kinds and some may be quite unjustifiable. But it is easy for the advocates of a general gratuitous system of medical assistance to give abusive names to the only means whereby such a system can be prevented and it tends to make unthinking people imagine that every form of deterrence is unjustifiable. Paragraph 220 says:—

> But it is a waste of public money to provide facilities for medical assistance if the persons for whom they are intended will not use them; and we have seen that the present system does deter classes who ought to benefit by them.

This seems to me misleading. A careless reader would assume that the evidence before the Commission showed much waste of public money through medical relief being supplied, and rejected by the class for whom it was intended. There was considerable evidence to the effect that even under the deterrent methods now in use much money was squandered over improper applicants; but the utmost that could be said to be proved by the evidence before the Commission as to the present methods deterring the respectable indigent poor from applying was that it might have occurred in a few instances. The assumption that a great many of the respectable indigent poor are so affected is quite a gratuitous one. The Majority Commissioners may mean no more than that a few of the respectable indigent poor are deterred, but their words might convey another construction; and if to remedy an evil that must exist under any deterrent all deterrents are to be got rid of, the last state of the respectable indigent poor might be worse than the first. It might be a greater deterrent to some respectable indigent poor that any loafer could get State relief for the asking than that they should be compelled to show to a proper officer their reasons for claiming State help.

It does not require much imagination to see in such a scheme of provident dispensaries the requisites for a system of gratuitous medical assistance for all the poorer classes which is not unfairly described by the Minority Commissioners as a "return to a State Medical Service of gigantic proportions." Such a State service is in many respects inferior to that offered by the Minority Commissioners, and would be just as dangerous to the interests of the medical practitioners of the country. If any poor person could demand treatment at these dispensaries with no more check than is indicated in the Majority Report, a large number of the poor now paying the so-called "cheap doctors" would certainly get their medical assistance for nothing. As the cheap doctor is probably the "cheap substitute" mentioned in the Minority Report as desirable to abolish, it is possible the Majority Commissioners hold a similar opinion. But it is hard on the numerous practitioners in poor districts now getting their living out of the small fees paid by these poor persons; neither is it certain that the treatment at the dispensaries will be any better than the "cheap substitute." All would approve of the coördination of the various overlapping bodies dealing with the State poor. Such a consummation is devoutly to be wished; but it is by no means certain it could not be just as well obtained under the present outdoor medical system or under a reformed system built up on the same lines.

It is a curious fact that the outcry for Poor-law reform was on account of abuses in the *general* relief of the poor; that the *medical* relief, if not faultless, was never regarded by the country at large as being in so bad a condition as the former; and if the latter alone had been in question, it is doubtful whether any Royal Commission would have been appointed to investigate it. Yet the changes proposed in the *medical* system of relief are far more drastic and far-reaching than those for *general* relief. The system proposed for general relief is entirely on the old lines. The relieving officer and his duties are changed only in name. It is true he will be much more hampered, and with the abolition of the deterrent methods will find it increasingly difficult to keep down the charges on the rates. The intimate relationship that has always existed between the duties of the relieving officer and the district medical officer will be largely interfered with and constant friction be caused. The criticism of Mr. Sclater Booth in Par. 64 is a weighty indictment of the proposed transference of certain powers of the relieving officer to the doctor, and if it does not deal directly with this particular point it undoubtedly governs it. Such a procedure would infallibly remove from the Destitution Authority a description of relief which requires to be carefully watched.

I cannot help thinking that the Majority Commissioners' scheme for medical relief *reform was not the result of purely* Poor-law considerations, but was influenced not a little by a [illegible] l. proper reform of the present Poor-law is to await the settlement of these matters, which are of a highly controversial character, so much the worse for the destitute poor of the country. If such reform cannot be brought about without the settlement of these other questions—which I do not for a moment admit—then this scheme of the Majority Commissioners is not large enough and would complicate rather than settle them. A far more revolutionary change would be necessary, more akin to the proposal of the Minority Commissioners, which I should be the last to wish to see attempted.

It must not be forgotten that the great majority of the medical profession are not in love with either provident dispensaries or with contract practice. Both must be largely augmented by the medical relief scheme of the Majority Commissioners, and it is to be feared that the injury likely to arise to professional interests by such augmentation will be much more apparent to the medical practitioners of the country than those from the more insidious and dangerous *proposals of the Minority Commissioners.*

II.—MINORITY REPORT.

In considering the views of those members of the recent Poor-law Commission who signed the Minority Report, it is of great importance that we should look closely at the objects which they appear to be seeking. Much of what they say is in a certain sense true and might be regarded as a reasonable impeachm[illegible] But dealing with the [illegible] in our midst since the [illegible] n many points outside the question. It has no real relation with the Poor-law Settlement of 1834. It does not affect to deal with the destitute, the class alone with which the Commissioners of 1834 had to do. As a matter of fact, it condemns the lines on which those Commissioners made their recommendations. It is clear that the legal destitute and their treatment is but a small item in the minds of the Minority Commissioners, for with that class are practically included all persons not coming within the category of the fairly well-to-do. This would include the great bulk of the wage-earners of the country, and no attempt is to be *made to separate* this large portion of the community from those who have been hitherto regarded as the legal poor. *To all imbued* with the "socialist" spirit of the age such a scheme presents many attractions, and if the objective of the "socialist" party is sound, and if under their guidance the national welfare would be better promoted it is quite justified. But it is difficult to see how the favourers of the present social system can approve of the legislative carrying out of the recommendations of the Minority Commissioners. Many of the details, no doubt, are of value and could be usefully employed in amending the deficiency of our present Poor-laws; but if the recommendations were adopted as a whole, far-reaching changes going much beyond anything that has hitherto been regarded as Poor-law reform would inevitably follow, revolutionising in no uncertain manner conditions on which modern society is constituted.

In dealing with portions of this section I will endeavour to show my meaning *more* clearly. At the commencement attention is drawn to the many evils under which the district medical officers are *compelled to* perform *their duties* and which interfere with the efficiency of their work. The general absence of many *auxiliaries, such as proper nursing* for their patients, surgical dressings, &c., is well *commented* upon, and far be it *from me to suggest* that in this respect there is not the most urgent need for reform. But interspersed with these criticisms are suggestions which, in my opinion, are far from sound. It is better, in my opinion, for the welfare of the *destitute* poor that the medical officer should be at the beck and call of a lay officer, with whom should rest the responsibility of calling in the doctor, rather than the latter *should have* thrust upon him a part of the responsibility that properly belongs to a lay official. No doubt the medical officer is often called in unnecessarily, but unless he sees for himself the nature of the case there is no security for the patient that a serious mistake may not be made or for the public that a scandal shall not result. If no test is to be employed to differentiate between the destitute and the ordinary poor, then I admit the views of the Commissioners appear more intelligible. When we are dealing only with the destitute, it is necessary to have a test whereby it *shall* be possible to distinguish that class from the rest of the nation. If the test is blamed as deterrent, this *deterrence* may yet be good for the public welfare; for it is not only the destitute that have to be *considered; there are other* public interests quite as important, which ought not to be lost sight of by the statesman. *Any test* would probably be deterrent to some of the respectable destitute, but without a test there would be no possible *means of distinguishing* between the really destitute and the great bulk of the poor of the nation. If *the reformer's idea be to relieve* the whole body of the poor in the same way as hitherto the Poor-law has only permitted *in the case of the* destitute, then, and then only, would there cease to be need for any test.

That some such view as this is held by the Minority Commissioners seems to me probable for the following reasons:—(1) Because *they* think that the essential duties of the relieving officer are "deterrent"; (2) because they complain of the restriction of medical orders, and object to a lay officer making surprise visits to ascertain if medical relief has been properly given; (3) because they object that Poor-law relief is bestowed "grudgingly"; (4) because they lay stress on the fact that the application of the sick poor is too late for remedial assistance; (5) particularly, on account of *their criticism* of the fact that numerous cases of infectious disease (non-notifiable) exist among the community, instancing specially the late period at which phthisis is usually dealt with under the Poor-law.

When dealing with a class that must necessarily be a great burden on the resources of the nation, it seems to me only in accordance with common prudence to exercise a wise supervision over all relief administered out of State funds. The fact that the State is interested in the quick restoration to health of the destitute, so as to restore them with the least loss of time to the wage-earning classes, does not seem to me to negative this supervision. The health of all its subjects is admittedly a matter of profound importance to the State; but if all legislation were enacted strictly on sanitary lines the result would be something which might perhaps be better to picture than experience. One thing is certain: individual liberty would become a negligible quantity. As medical relief is believed, and not without good reason, to be a common road to pauperism, [illegible] cannot be excepted, and salutary supervision [illegible] ration of relief [illegible] under observa- [illegible] urged that it is [illegible] *not in order to see that* the doctor's [illegible]ctions are carried out—obviously not, as a lay person would hardly be in a position to—but to observe whether the Poor-law is being abused. In the ordinary ups and down of working-class life does it never happen that the breadwinner suddenly finds good work bringing in as much and even more than most of his neighbours earn who are paying their way? Would such a one, if subject to no inspection, always inform the public authority when assistance was no longer necessary? The difference drawn between the moral effect of the relief administered by the public health and the destitution authority upon the recipient is very questionable. As the conclusions seem to be founded on the character of those relieved in our public health institutions, it is needless to point out that the recipients of this *relief* are drawn from practically the whole population. The moral character of many before receiving *public relief* would be very different from that of most of the destitute. That administration of gratuitous public relief has any different effect upon the moral nature of the recipient, whether it is given by the destitution or *public health authority, I must* respectfully decline to admit until better evidence can be adduced than has yet been published by *the Commissioners.* Public relief is not necessarily degrading—the real test is *the necessity of the recipient. I consider a genuine pauper* more honourable than one much *higher in the social scale* that accepts public relief he *can afford to pay for. Unless* we are to take the view that all the poor are to avail themselves of State relief without supervision, or with no more supervision than is outlined by the Commissioners, such criticism loses much of its weight.

Attention is drawn by the Minority Commissioners to the number of infectious cases and other sickness constantly occurring among the poor for which no medical assistance is sought. This is undeniably common to the whole of the larger class. To deal with those of the destitute only, according to the view of the Commissioners—and rightly too from their point of view—would be useless to promote the larger public health they contemplate. Therefore it is clear that the whole of the larger class, embracing nearly the whole of the working and lower middle classes of the community, must be included in their scheme of medical relief. Doubtless it is a serious question that so many cases of infectious disease should elude the present health authority, but the plain remedy is to extend the Notification Act to include all, not excepting phthisis. There is good reason to believe that nearly all the *notifiable* diseases do come to the knowledge of the public authority; so that it might be reasonably hoped that the present unnotifiable cases would then be known also. If all the evils arising from inadequate, and non-medical, treatment of infectious and other diseases, were to be redressed; if attempts were to be made to seek them out to ensure treatment in their earlier, and more remedial, stage, no ordinary medical service would be large enough. Indeed, short of a national medical service, embracing the bulk of the medical profession, it would be Utopian to attempt to grapple with such an Augean task. Whether the British public would consent to such an interference with their natural liberty, even for their own good, I will not venture to speculate on; whether the net result to the nation, if this obstacle were removed, would be for its ultimate good is certainly open to question. But that the experiment would be very costly, and involve considerations that cannot lightly be dismissed, must be clear to all.

It is a trite saying "That people cannot be made moral by Act of Parliament." It seems to me that it is equally open to question whether all, or even a large number, of the evils aimed at by the Commissioners can be stamped out by legislation. In the process of education, by gradually improving the hygienic knowledge of the masses, there must necessarily be a diminution of these evils. We have seen much amelioration in our time, and expect to see more. But it is devoutly to be hoped that the people of this country will think twice before they give a *carte blanche* to any party of reform to endeavour to obtain by a short cut what can only be safely attained by slow and gradual improvement on those lines on which the growth of the nation has naturally taken place. Much of the reasoning in this section—where reasoning has been attempted—does not carry conviction, and some of the evidence on which it is based is still more open to cricitism. I refer to the inferences drawn of the deterrent character of the Poor-law from such evidence as the statement of a doctor, also a guardian, that the average district medical officer does not give the satisfaction he ought to his patients (Possibly he does not give the "bottle of medicine" so freely as his private professional rival); the statement that the working classes "have the idea that the attention they get from the Poor-law medical officer is not satisfactory" (It would be interesting to know their views of the other private doctors in their district); and the statement of the British Medical Association witnesses that "People avoid calling in the parish doctor, because he is the parish doctor." This last is sadly inconsistent with the evidence that many practitioners take a Poor-law appointment as an introduction to private practice. The Hon. Sydney Holland, again, came to the conclusion, when a guardian, that "every applicant for Poor-law relief was a swindler"; but this does not prove that even the majority of the guardians throughout the country come to such strange conclusions; still less that the average district medical officer regards all his pauper patients as "swindlers." On the whole, I cannot help regretting that there were not a few lawyers among the Commissioners. If that had been the case I do not think so many sensational statements and highly imaginative opinions would have been allowed to rank as evidence.

How far the well-being of the nation would be promoted by the carrying out of a vast scheme of medical relief for the majority of the poor, with no other check to its abuse than the right of the State to recover the cost from those able to pay, I do not feel in a position to decide. The Commissioners own strictures on the present system of "relief on loan" might be aptly considered in this connexion. I can easily conceive that in practice such a scheme would be accompanied by many evils—or what I should consider evils. The present system of general medical practice would certainly be revolutionised. If most of the present practitioners became State doctors, some sort of living would be found for them. Whether they would do better work for the State for a fixed, but modest, salary, probably much less than the average of what they now earn as private practitioners, is a question I do not propose to enter into. Last, and not least, there will remain to be considered whether the army of State patients will be satisfied with the official medical attendance provided for them, especially that portion—probably not a large one—from which under the consistent Parliamentary Code as to chargeability medical fees have been recovered. As this medical service is to be under strict State supervision, it must be assumed that it will be thoroughly efficient and up to date, and that the "mere bottle of medicine treatment" will have become non-existent. Nevertheless, it is not impossible that the poor may draw an unfair comparison between this official medical treatment and what they were accustomed to under their old "pay" doctors. One class of the community, and that, I fear, a considerable one—I allude to the quack doctors and other empirics—would gladly welcome the change. If any such dissatisfaction were to arise, their time would be one of unexampled prosperity. It could hardly be made penal for a State patient to consult a herbalist. At present there are many well-qualified practitioners to whom the dissatisfied patient of a particular doctor may apply. But when all are official doctors, and the independent and competitive doctor is for the most part only preserved in the records of a bygone time, there will only remain the herbalist to whom the people can resort.

In such a service many interesting problems dealing with the relations of patient and doctor would incidentally have much light thrown on them; and medical etiquette as between doctor and doctor, and patient and doctor would require large modification. The ethical duties of the doctor to his patients would be swallowed up in the larger duties owed by the doctor to the State, the common paymaster. This is probably, as the Minority Commissioners think, right and proper. They may be correct, but it certainly is not the view hitherto held by most medical practitioners.

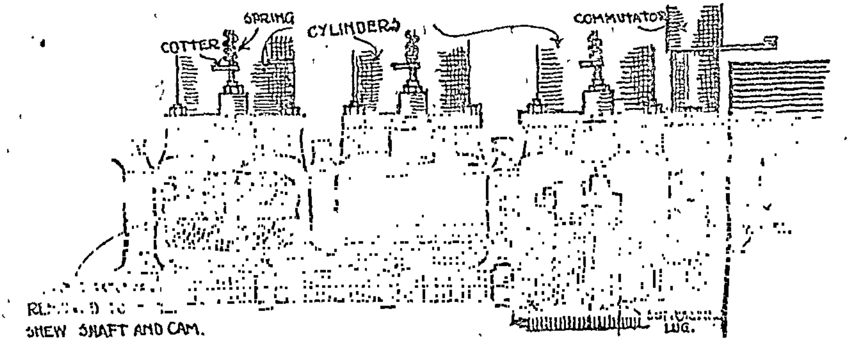
So much, then, for the professional side. But will the effect of the proposed changes be limited only to the business of the doctor. Poor-law relief is not only medical, and it is to be presumed that in the same way as medical relief is given other relief must be provided. If no questions are to be asked of the poor person claiming medical relief, it is hard to suppose that the indigent poor are to suffer from any form of deterrence when seeking other necessaries of life at least as important for their welfare and the ultimate good of the State as medical attendance. It has often seemed to me that the poor wage earner lacking bread, clothing, or other necessary commodity for his family, is as much entitled to expect sympathy from the vendors of the same as from the doctor; and that the latter may take with as little shame the pence of the poor as the prosperous small tradesman, butcher, baker, or general storekeeper. I am compelled to admit that, as a matter of fact, a large portion of the public think otherwise. Now, with regard to all these small tradesmen, how will they be affected? By giving State assistance on easy terms to the proposed large class of poor persons—not destitute, for the very term "destitution authority" or any idea of destitution being the sole claim to State relief is anathema to the Minority Commissioners—will the welfare of these tradespeople be promoted? They pay rates, and out of their industry is to come much of the money that is to supply this indiscriminate State relief. It will seem hard to have to pay out of the rates for necessaries which the poor used formerly to purchase of them. With increasing burdens and dwindling business it may well happen that not a few of the small tradesmen will find it most to their interest to "qualify" for a place among the State assisted, together with their former customers, and instead of adding their contributions to the public purse do their best with other poor persons to get the most they can out of it.

MOTORING NOTES.

BY O. T. W. HIRSCH, M.R.C.S. ENG., L.R.C.P. LOND.

Valve Lifters and their Guides.

WHEN a valve lifter fractures, a broken portion may, on those cars which have one case for the crank and cam shaft, fall into the crank case. The results may be rather disastrous to the crank. It is therefore a good plan occasionally to inspect the lifter guides, as if they wear the lifter may jam and so be broken, with expensive results. It is cheaper to obviate such possibilities by occasionally seeing if the guides are worn, and if so to either bush them or replace them by new ones. When inspecting a car with a view to purchase, the design and construction of the valve lifters and guides should be thought of. In the better form of lifter a roller is fitted where it receives the impact of the cam; short stems, too, are better than long ones, and the whole lifter, the U-shaped piece holding the roller and the stem, should be a solid forging. Steel blocks, with the stem screwed in and pinned, may last for years, but they may also give, and these little matters, which certainly add to the cost of production, are worth the extra expense, for they minimise, if they do no more, the possibility of a breakdown beyond roadside repair. For simplicity in lubrication the cam case is generally cast in one with the crank case; of course, oil can thus reach the cams and lifters, but the reverse also holds true. A broken roller or block can have a trial of strength with the crank, and in the trial both may suffer, as well as the owner's pockets. I therefore think it would be a good plan if some wide-mesh gauze wire was fitted between the cam and crank case; oil could easily pass, but if an end broke the expensive crank would be saved, and the cam shaft if damaged might be straightened, while the crank as a rule cannot be brought to its proper shape again. The accompanying sketch shows the general construction of an engine with the exhaust cams on one side. In most modern cars the inlets are on *the same side* and are operated off the same cam shaft, but this construction has its drawbacks. Valves, of course, have *occasionally* to be taken out so as to grind the *seats*, as these may cease to be gas-tight through dust or burnt oil lodging and making an impression on either the seat or valve. Therefore let me advise would-be buyers of cars to *select one* with the magneto not on the same side as the cam *shaft*. I have a memory of a friend who did not think of this point, and every time he desired to take out a valve he had *first* to remove the magneto, which was annoying.



Sketch showing the general construction of an engine, with the exhaust cams on one side.

On Grinding Valves.

This operation is generally the first serious undertaking that a novice essays, and I *think* I can truly add that it is usually done months before it is required for the engine's good. It is easily carried out, and, of course gives the feeling that the compression is good; still it is as well to recollect that *emery* is not a lubricant nor a good application for pistons or valve guides. It is rather a bother without some form of spring lifter to remove the valve cotter or key. A very useful compressor is sold by Messrs. Brown Bros. of Newman-street, London, under the name of the "Duco" valve spring lifter. Messrs. Gamage of High Holborn, London, also stock a lifter known as the "Nesthill," and a compressor called the "B.K." With any of these, providing the magneto or exhaust pipes are not in the way, a valve can be speedily and easily removed. To perform the operation take out the valve and dab on the valve seat with a clean finger a little No. 220 corn emery rubbed into a paste with some linseed oil or some of Richford's grinding compound. Then lower the valve into position and with a screw-driver slowly twist it one way and then the other, taking care to keep the valve well pressed down. After doing this some 10 or 12 times wipe away the emery and replace it by a drop of oil and repeat the movements; then wipe with a paraffin rag and notice if a clean ring has been obtained on both valve and seat without any depressions, and if this is the case the job is done. Valves on cars used daily should be anyway examined every three months, and if they are deeply pitted they may need skimming in the lathe prior to grinding in. On most cars there is about a thirty-secondth of an inch clearance between the valve tappet and stem. This is to permit of expansion through heat when the engine is running, otherwise the valve may just touch the tappet and so not "seat" properly. As after repeated grindings the valve may con [illegible] see that when the [illegible] between the tapp [illegible] valve springs, especially exhaust ones, may become weak and thus allow an exhaust valve to open on the suction stroke; it is therefore always a good plan to carry a few spare ones.

The Use of the Stethoscope in Locating Motor Mechanical Faults.

In a recent issue of THE LANCET I wrote about the similarity between medical and motor diagnosis (if I may [illegible] have had sent me a [illegible] use of the [illegible] mechanical faults. The author, who is a "motor physician," and has to maintain a considerable fleet of commercial motor vehicles in running order, states that he finds a stethoscope specially adapted for finding faults in machinery. By its aid he is able to tell if a motor valve is closing correctly, the morbid click being as marked as the diseased one in a case of mitral regurgitation. The grating of a broken piston ring, defective pump vanes, loose brasses, fractured balls in a ball race, faulty bearings, the ticking of "shorts" in a coil, and many other troubles he has by this means detected without having to dismantle the part.' Just after reading this article I came across a multi-cylinder car in which the explosions were erratic, and with the *stethoscope* I speedily discovered the cause, which was an internal "short" on the coil of No. 3 cylinder.

On Restarting the Car without a Starting Handle.

On some of the *older* cars the starting handle was detached and usually was carried loose on the floor. It could thus drop off. Even fixed starting handles can, as a result of letting them slip, become useless for the purpose of starting the engine, for the notch may wear and thus no longer engage with the corresponding one on the crank. At a recent examination held by the Royal Automobile Club for their driver's certificate, I noticed the question that suggested this paragraph: How would you start your car on a level road if the starting handle was lost or useless? Sitting at home, and reading about these things in print, it is perhaps difficult to imagine anyone not immediately knowing what to do, namely jack up the back axle, put the second-speed gear in mesh, and thus start the car by pulling one of the back wheels round. The obvious, however, does not strike one always at the time of emergency, when it is needed, and that must be my excuse for mentioning this "tip."

THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

THE visits which the *British Association for the Advancement of Science* made to Canada in the years 1884 and 1897 were so successful that a third transatlantic voyage to the Dominion was undertaken on the occasion of the present annual meeting, and the proceedings commenced in Winnipeg on August 25th. The President, Sir Joseph J. Thomson, Cavendish professor of experimental physics in the University of Cambridge, delivered a very able address, to which further reference is made in another part of our present issue. In THE LANCET of August 21st we mentioned the titles of the various sections, and now give a brief outline of the addresses delivered by the Presidents of some of them, together with abstracts of a few papers dealing with subjects of medical interest.

In the Anthropological Section Professor JOHN L. MYRES, the President, took the Influence of Anthropology on the Course of Political Science as the principal theme of his discourse. He said that anthropology in its modern developments was a very young science—barely as old as chemistry—and was almost alone among the sciences in being able to reckon any of its founders among the living. The political problems connected with anthropology were, however, of much older date and began to be seriously studied by philosophers in the seventeenth century, when it had become apparent from the narratives of European travellers that great absolute monarchies existed in distant countries which knew nothing of the pope or the emperor. Professor Myres then proceeded to discuss the effect produced upon educated opinion in Europe. Shakespeare's Caliban and the savages described in Defoe's "Robinson Crusoe" were sketched from types of mankind not previously utilised by the dramatist or the romance writer. John Locke, in the "Essay on the Human Understanding," made copious reference to the habits and customs of native races in South Africa, Brazil, Siam, China, &c.; in the "Two Treatises on Government" he showed himself an opponent of the patriarchal theory of society and appealed to modern discovery in the new worlds beyond the oceans against traditional accounts of ancient societies in the Mediterranean basin and the Semitic East. The doctrines of Montesquieu, Rousseau, Voltaire, Hermann Post, and many others were also discussed. In conclusion, Professor Myres urged the extreme importance of establishing in Canada an ethnological survey for studying not only the Indian aborigines but the European immigrants as well.

Miss A. C. BRETON read a paper on Race-types in the Ancient Sculptures and Paintings of Mexico and Central America. She said that the different race-types in the ancient sculptures and paintings found in Mexico and Central America formed an important anthropological study, and that there was in existence an enormous mass of material, evidently of many periods, including sculpture, archaic stone statuettes, portrait statues and reliefs, and magnificent stelæ In terra-cotta or clay there were hundreds of thousands of small portrait heads and figurines found at Teotihuacan, Otumba, the neighbourhood of Toluca, and other ancient sites. Larger clay figures have been found in quantities in tombs, as in the States of Jalisco and Oaxaca; these were made as offerings, instead of the sacrifice of a chief's wives and servants at his burial. Small jadeite heads and figures, also found in tombs, show strongly marked types. If there were few specimens in gold it was because throughout the country the Spaniards ransacked the tombs for gold. In painting there were picture manuscripts, frescoes, and a number of vases with figures from Guatemala and British Honduras. This material is now available for students in Mr. A. Maudslay's "Biologia Centrali-Americana, Archæology," Dr. E. Seler's collected works, the publications of the Peabody Museum, and the reproductions of the Codices by the Duc de Loubat, also in the splendid collections of the Museum für Völkerkunde at Berlin, the Mexican Hall of the Natural History Museum at New York, and the Peabody Museum.

Mr. JOHN MACLEAN read a paper on the Blackfoot Medical Priesthood. He commenced by defining medicine men, or, to use a better term, the medical priesthood, as doctors, prophets, and priests, and gave the different grades in the priesthood. The subject of initiation was then dealt with, and the course of instruction was outlined. Previous to this the would-be medicine man underwent a period of voluntary seclusion, during which he fasted and saw visions. The dress and facial decoration of the fraternity were next described and the sacred numbers were explained. The subject of disease was next treated, the Blackfeet being particularly prone to small-pox and pulmonary tuberculosis. Dr. Maclean then treated of the medicine man in connexion with religion, such subjects as animism, sacred stones, sacrifice, spiritualism, hypnotism, prophecy and incantation being discussed, as well as medicine songs, charms, and amulets. In conclusion, he considered native medicines and remedies, and discussed the value of the work of the medicine men among the natives and the influence exercised by them on the native religion.

Professor H. E. ARMSTRONG'S presidential address to the Chemical Section amounted, generally speaking, to a review of chemical progress. The address was somewhat long and discursive, for he discussed not only the chemistry of carbon compounds, the constitution of matter, the triumphs of synthetic chemistry, but also educational topics, the future of the race, questions of the inequality of the sexes, heredity. and so forth. He was not long in attacking the "ionic" school. Ostwald, he said, has charged his test-tubes with ink instead of with chemical agents, and by means of a too facile pen has enticed chemists the world over into becoming adherents of the cult of ionic dissociation—a cult which he thought might well be ranked with that of "Christian Science," so implicit has been the faith of its adherents in the doctrines laid down for them, so extreme and narrow the views of its advocates. At last, he said, "the criticism which has been far too long delayed is being brought to bear and the absurdity of not a few of the propositions which the faith entails is being made evident; it is to be hoped that we shall soon enter on a period in which commonsense will once more prevail; that ere long an agreement will be arrived at, both as to the conditions which determine it and as to the nature of chemical change in general. The lesson we shall have learnt is one of no slight import if it but teach us the ever-present need of questioning our grounds of belief, if it serve to bring home to us the danger of uncontrolled literary propagandism in science, if it but cause us always to be on our guard against the intrusion of authority and of dogmatism into our speculations." Proceeding, he defended, as he has done on previous occasions, the tendency of chemists to devote themselves to the chemistry of carbon, and said their decision was justified by fruitful events. The central luminary of our system, he insisted, was the element carbon. The constancy of this element, the firmness of its *affections* and *affinities*, distinguished it from all others. Only those, he held, who are truly conversant with the root conceptions of organic chemistry are in a position to attempt the interpretation of the problems of science as a whole, or even to understand the framework upon which it is built up. And yet, he added, we continue to withhold the knowledge of the properties of carbon from students until a late period of their development, and, indeed, when he insisted recently that organic and inorganic chemistry should be taught as one subject to medical students he was told that it could not be, and that in fact the attempt had been made with disastrous consequences. He trusted that the futility of such an attitude would soon generally be realised. Coming to the recent developments in radiochemistry, he said that the conception that the breakdown of radium is spontaneous, and apart from all external impulse or control is also one which should be received with caution. There is reason to suppose that in all ordinary cases in which compounds undergo decomposition spontaneously the decomposition is conditioned by an impurity; the effect, moreover, is usually cumulative. This is true of highly explosive substances, such as chloride of nitrogen and gun-cotton, for example. It might be supposed that something similar would happen in the case of radium, but apparently such is not the case; it is assumed that occasionally a molecule expl[illegible] being incited thereto [illegible] neighbours. The al[illegible] some way acts as a receiver, transforming energy from some external source to which ordinary substances fail to respond and being thereby stimulated to decompose, is at present out of favour, although perhaps more in accordance with its peculiar behaviour. The liberation of helium as a product of radio-active change is in itself a significant fact, in view of the possibility that helium may be an element of intense activity. Nothing in connexion with the problem is more surprising, however, than the apparent production, in course of time, of a whole series of degradation products which differ greatly in stability—such behaviour is entirely without precedent and not at all becoming in elements. No such remarkable and inspiring problem has ever before been offered for solution. We can only wonder, he said, at the results and admire the genius which some have displayed in interpreting them, Rutherford in particular. Yet outsiders may well hold judgment in suspense for the present: whilst it is permitted to workers to make use of hypothesis in every possible way in extending inquiry, the public are in no wise called upon to accept such hypothesis as fact. But apart from the suggestion that elements may give rise to others spontaneously, we have been entertained of late, he added, with stories of elements being converted into others under the influence of the energy let loose by the breakdown of radium. There is reason, however, to suppose, he thought, that the powers of radium may have been greatly overpainted; energy of almost any degree of intensity in the form of high-tension electricity is now at our disposal and the effec[illegible] n living tissues, glass, &c., is of th[illegible] effected by the Roentgen ray disc[illegible] being that the effect is produced more rapidly; it is not to be imagined, therefore, he added, that the discovery of radium has put any very novel intensity of power into our hands. Professor Armstrong used similar slighting terms in regard to the theory of electrons. Of late, he said, there has been talk of electrons, but what is said is little more than superficial paraphrase, in the advanced scientific slang of the day, of the ideas which have long been current. When, following Odling, we represent valency by dashes written after the elementary symbol, we give clear expression by means of a simple convention to certain ideas that are well understood by all among us who are versed in the facts; to speak of electrons and use dots instead of dashes may serve to mislead the unwary, who hang on the lips of authority, into a belief that we [illegible] explanation of the phenomena, but those [illegible] have reached only the let-it-be-grantec [illegible] feel that the electron is possibly but a figment of the imagination, will remain satisfied with a symbolic system which has served us so long and so well as a means of giving simple expression to facts which we do not pretend to explain. Professor Armstrong concluded by emphasising the great importance of applied science. "You will be wise in Canada," he said, "if you take care to select no small number of your abler students—young men of promise physically as [illegible] train them as chemists. Of late [illegible] every side to the incon[illegible] aterials, especially coal, iron, and wood, are being used up in all civilised countries; it is difficult to interest the public in such a subject, as few can appreciate the consequences, owing to the general ignorance of science and to the existence of an optimistic belief in the power of scientific discovery. But nothing will compensate for the exhaustion of your coal and iron supplies. It is your bounden duty to economise these in every possible way. The chemist and engineer will be required to help you in effecting economies by improving present methods of treatment. But the further question arises whether it be not also your duty, here in Canada particularly, without loss of time, to effect still greater economies by utilising the vast stores of energy in your possession, in the form of uplifted water, which now run to waste. The falls of Niagara are among the most glorious and entrancing sights in the world, yet it is permissible to question if any part of their available energy should be dissipated—whether the claims of posterity do not forbid us to allow æsthetic considerations to prevail in such a case."

In the Physiological Section the presidential address delivered by Professor E. H. STARLING of University College, London, dealt nearly as much with sociology as with biology. The special preoccupation of a physiologist being the study of man, he proposed on the present occasion to regard man "as a machine played upon by environmental events and reacting thereto in a way determined by its physical and chemical structure," and "as the latest result of a continuous process of evolution which, begun in far-off ages, has formed, proved, and rejected myriads of types before man himself appeared on the surface of the globe." In the course of the thesis thus outlined, he said that the power of speech was probably developed in the first [illegible] among primitive men [illegible] to say, of [illegible] ls in a task [illegible] olved. As soon as experience could be symbolised in words the community received the advantage of the foresight possessed by any individual who happened to be endowed with a central nervous system which transcended that of his fellows in its process of dealing with sense impressions. It was therefore natural that a class of individuals should be developed, not pursuing the ordinary avocations, but devoting themselves to the study of sequences of sense impressions, and the results of such study, set into words as summary statements of sequence, were known to us as the Laws of Nature. This study of the sequence of phenomena was the office of science.

In the same section Miss IDA Z. REVELEY, M.A., and Dr. SUTHERLAND SIMPSON, of the Physiological Laboratory, [illegible] pap[illegible] said that in their experiments [illegible] lesion was made involving the whole of the motor cortex in the left cerebral hemisphere and the degeneration from it followed by the Marchi method. Above the decussation nothing calling for special notice was observed except the relatively small area occupied by the transverse section of the pyramids in the medulla oblongata. Fibres began to cross over from the degenerated pyramid about the level of the calamus scriptorius and continued to do so till the lower level of the medulla was reached. They were found in small but well-defined bundles, which after decussating passed backward through the grey matter and then turned downward in the funiculus cuneatus, and, to a less extent, in the funiculus gracilis, close to the grey matter. In the first cervical segment they were found in the columns of [illegible] and Goll, but a comparatively large proportion [illegible] in the grey matter of the bulb and probably [illegible] At the level of the seventh cervical segment they ran down close to the postero-mesial border of the neck of the posterior horn and were much less numerous than in the first cervical segment. The number rapidly diminished caudalwards and at the level of the fourth lumbar segment the tract was represented by not more than half a dozen degenerated fibres. In the sacral region they were entirely absent. A point worthy of notice was the large proportion of fibres which, after crossing, terminated in the grey matter of the medulla oblongata, and the relatively small number which passed down the cord.

In the Zoological Section, Mr. A. E. SHIPLEY, the President, after a reference to the centenary of Charles Darwin's birth, commented on the gradual disappearance of several well-known mammalian types, including European and American bisons, whales, seals, elephants, and indigenous Australian animals. He said that in recording the habits and physical f[illegible] anthropologists were settin[illegible] would do well to follow. [illegible] connected with what he designated as "[illegible] such as the apportionment of certain animal types to certain museums, synonymy in zoological nomenclature, and the defects of the present system of appointing the heads of departments in some museums. In concluding, he described the present position of international ocean research, with special reference to the distribution of commercially valuable fish in the North Sea and the Eastern Atlantic. He said that each of the participating nations had at least one large laboratory devoted to this work, the English ones being at Plymouth and Lowestoft.

In the same section Dr. George M. Gould of Ithaca, New York, read a paper on the Rôle of Visual Function in Animal and Human Evolution. He said that he sought to bring to better recognition the difficulties encountered in the creation and the adaptation of the eye to the environment, a large and intimate part of the environment being the animal and human body itself. The difficulties were grouped into those which relate to:—(1) The embryology and optics of the eyeball; (2) the rôle of vision in the development of self-motility of the body; (3) the progress from divergence to parallelism of the optic axes, or from laterality to forward-looking; (4) the adaptations consequent upon the assumption of the vertical posture of the body; (5) the development of the shading mechanisms of the retina; and (6) the struggle against astigmatism and other forms of ametropia, accommodational failure, cataract, ocular and systemic disease. Embryology was suggestive in the facts that the essential part of the eye, the retina, was cerebral substance pushed outside the skull. Ascent of types to fuller or higher function was measured and also largely caused by the slow approach of the visual axes from extreme divergence to the parallelism of Simiæ and Homo, fighting power and individualism proceeding *pari passu* with every approach to parallelism of the visual axes. A still more profound visual difficulty was overcome when it was found visually possible to guide and render habitual the change from horizontality of the animal body to verticality, partly effected in the Marsupialia and the Simiæ but successful in Homo. With the verticality of Homo severe labour was thrown upon the lumbar portion of the spinal column, but the influence of the ocular function of civilisation was required to produce the 80 per cent. of cases among our educated classes of lateral spinal curvature. With Homo came early the use of the hands as manipulative tools, the development of right-handedness and left-handedness, the formation of language, and the location of the cerebral centres of right-handedness and speech in one cerebral hemisphere.

The Mathematical and Physical Section had for its President Professor Ernest Rutherford, Macdonald Professor of Physics in McGill University, Montreal. He took for his subject the Present Position of the Atomic Theory in Physical Science. His first illustration was taken from the well-known phenomenon of Brownian movement first observed with the microscope by the English botanist Brown in 1827. Ehrenhaft in 1907 showed that the Brownian movement was not confined to liquids but was exhibited far more markedly by small particles suspended in gases and viewed by the ultra-microscope, the mean free path for particles of the same size being much greater in gases than in liquids. Experimenting with liquid emulsions, Perrin found in 1909 that each small particle had the same average kinetic energy of movement as the molecules of the solution in which they were suspended; in fact, the particles in suspension behaved in all respects like molecules of very high molecular weight. It was probable that Brownian movement resulted from the movement of the molecules of the solution, and was thus a striking, if somewhat indirect, proof of the general correctness of the kinetic theory of matter. His next illustration was taken from recent work on radio-activity, and he explained the data from which a numerical estimate was obtained of the α particles forming one cubic centimetre of helium gas at standard pressure and temperature. The number was, of course, very large; it was represented by 20 integers, the first three figures of which were 256.

In the Botanical Section the presidential address by Lieutenant-Colonel David Prain was devoted mainly to a general consideration of systems of classification. He said that the two-sided task of the systematist was to provide a census of the known forms of plant life and to explain the relationships of these forms to each other. The work was partly descriptive and partly taxonomic, these two aspects being so interdependent that re-orientation in botanical study has led to seismic disturbances in the taxonomic field, but the materials supplied by descriptive work have remained unaffected. In the present state of our knowledge uniformity in the delimitation of what were termed "species" was unattainable. The thoughtful systematist found that forms which in one collocation need only be accorded a subordinate position, must under other conditions receive separate recognition. The industry displayed in elaborating monographs which attributed a thousand species to genera in which the normal systematist could hardly find a score must often be effort misplaced, while the opposite extreme, or undue reduction of the number of species assigned to a genus was an even worse fault. This impossibility of a uniform delimitation of species seriously weakened the value of normal systematic results for phytogeographical purposes, because the units termed "species" that were most useful in floristic and economic study were often too finely cut to serve distributional ends.

In the Agricultural Subsection, the President, Major P. G. Craigie, spoke mostly on the subject of the statistics of the world's wheat-supply. He said that the course of the wheat acreage from the year 1870 to 1884 and thence onward to 1898 showed during the earlier portion of the period a material advance outstripping that of population and afterwards a serious check followed by a subsequent advance. Taking Russia, the United States of America, Argentina, Australia, and Canada as typical of the exporting centres, there had been during the last decade a much greater growth of wheat acreage than might have been expected from the previous rate of progression.

REPORT OF THE DEPARTMENTAL COMMITTEE ON THE WORKING OF THE MIDWIVES ACT, 1902.

THE following is a summary of the Committee's principal recommendations showing in how many directions the Committee, notwithstanding its opinion that much public good has come from the Midwives Act, is willing that the Act should be modified:—

(a) SUPPLY AND TRAINING OF MIDWIVES.

(1) The Committee deprecate any postponement of the date (31st March, 1910) after which uncertified women will, under Section 1 (2) of the Act, be prohibited from attending habitually and for gain women in childbirth, except under the direction of a medical practitioner, or in cases of emergency.

(2) With regard to the suggestion that in sparsely peopled rural areas annual licences to practise, based upon a modified examination, might, if a serious deficiency occurred, be issued to uncertified women, the Committee, while loth to recommend any departure from uniformity, think that the matter may be left to the discretion which the Central Midwives Board are empowered to exercise in regulating the conditions of admission to the roll.

(3) The Board might properly consider the expediency of giving another opportunity of enrolment to such trained women as were qualified for admission under Section 2 of the Act, but failed to apply before the appointed day (31st March, 1905).

(4) The Committee, regarding the provision and maintenance of an adequate supply of midwives mainly as a question of organisation and distribution, are of opinion that there is no need of any subvention from the State.

(5) The organisation and distribution of the supply should be undertaken by the coördinated action of local authorities and voluntary agencies.

(6) As the most suitable machinery for giving effect to this recommendation, the Committee advocate the establishment of county nursing associations throughout the country, working in coöperation with the local supervising authorities, and affiliated, wherever possible, to some central body such as Queen Victoria's Jubilee Institute.

(7) The details of method will necessarily vary in different districts, but the Committee are of opinion that, in general, the formation of county training homes, and of emergency homes, from which midwives can be drafted temporarily to places where their services are required, will be found a hopeful basis of organisation.

(8) The powers of county councils should be extended so as to enable them to charge upon the county fund contributions in aid of the training of midwives for work in their areas.

(9) Boards of guardians should be encouraged to exercise their powers to subscribe to the support of nursing associations in return for services rendered.

(10) The general introduction into this country of the Irish dispensary midwives system appears to be unnecessary; but, in places where arrangements cannot be made for the utilisation of voluntary agencies, it might be advisable that boards of guardians should be authorised to appoint district midwives.

(11) The Committee consider that in rural districts the practice of midwifery might, with safety and advantage, be combined with district nursing, provided that the requirements of the medical officer of health and the Rules of the Central Midwives Board are carefully observed. In certain areas the system of cottage resident nurses would be found suitable.

[illegible]

(16) An increase in the number of examination centres is recom- [illegible]

[illegible] to adapting them, so far as possible, to the [illegible] and restricted vocabulary of the class of women likely to present themselves from rural districts.

(20) The Central Midwives Board might consider the propriety of [illegible]

(b) REMUNERATION OF MEDICAL MEN SUMMONED ON THE ADVICE OF MIDWIVES

(1) A secure expectation of payment should be given to a medical practitioner summoned on the advice of a midwife in a case of emergency.

(2) The Poor-law authority should be responsible for the payment, and should be empowered to charge the fee paid as "relief on loan" to [illegible]

(c) DELEGATION OF THEIR POWERS BY COUNTY COUNCILS.

The power of delegation to district councils under Section 9 of the Act should be withdrawn; and, in cases where it is still exercised, the delegation should be revoked.

(d) MISCELLANEOUS.

(1) *Constitution of the Central Midwives Board*

[illegible] increased from nine to twelve, [illegible] ident of the Council, [illegible] nt Board, the British [illegible] Officers of Health. [illegible] ives Institute should [illegible] cal practitioner, and [illegible] Association should be discontinued.

[illegible] the safeguards provided by [illegible] be [illegible] any [illegible] ard

(2) *Finances of the Central Midwives Board.*

[illegible] amended by providing that any [illegible] in their annual [illegible] ivy Council, be [illegible] on the basis of [illegible] ns instead of on [illegible] their intention [illegible] of the Central [illegible] es, such [illegible]

(3) *Midwives Roll.*

[illegible] them with the expense incurred.

(4) *Disciplinary Functions.*

(1.) The existing powe [illegible] Section 8 (3) of the Act, [illegible] prevent the spread of [illegible] cases of infection and [illegible] infection. [illegible] submit her case to the Board.

[illegible] striking [illegible] pay the [illegible] quired to [illegible] recommended.

(5) *Private Lying-in Homes*

The suggestion that lying-in hom [illegible] specially registered seems worthy of [illegible]

(6) *Prematurely born Children*

[illegible] midwives to ask [illegible] f the child, might [illegible] nce to premature births.

(7) *Ophthalmia Neonatorum.*

[illegible] medical help should be [illegible] in the mother or [illegible] notifiable under the [illegible] in the list of the [illegible]

[illegible] who actually delivered the [illegible] efficiency and check abuses in the practice of midwives. It would be desirable that such particulars should be required in all notifications under the Act of 1907, and, if necessary, the Act should be amended in this sense.

(9) *Still-births.*

Statutory provision should be made for the registration of still births.

(10) *Inquiries by the Local Government Board into the effects and working of the Act.*

[illegible] might with [illegible] the [illegible] ould [illegible] tary [illegible]

(11) *Minor Amendments of the Act.*

[illegible]

A FATAL CASE OF SEA-SICKNESS.—Deaths due [illegible] are extremely rare, but an inquest was held [illegible] body of a lady who was found [illegible] following on sea-sickness and extreme prostration during a trip on a "pleasure" steamer.

Looking Back.

FROM

THE LANCET, *SATURDAY*, Sept. 3rd, 1831.

BOARD OF HEALTH.

PRELIMINARY STEPS ADVISED TO BE TAKEN ON THE FIRST APPEARANCE OF CHOLERA.

It is of great importance that each town or village, particularly those on the coast, should be prepared with the best-arranged means to meet such a calamity as the breaking out of the disease now raging in the North of Europe, so as to prevent confusion upon the emergency of the moment, and be ready to act upon a well-considered system for preventing the spreading of infection.

With this view the Board recommends the formation of a local board of health at each place, to consist of the chief magistrate, the clergyman, one or more medical gentlemen, and two or three of the principal inhabitants, who may immediately, and as occasion requires, correspond with the Board of Health in London, the medical members of the local boards being deputed to write upon all subjects relating to any symptoms of the disease.

The best means of preventing the spreading of infection are, the immediate separation of the uninfected from the sick, by their prompt removal from the house of any infected person, or by the removal of any individual affected with the disease, if possible, to some house in a dry and airy situation appropriated to the purpose; but in the event of such removal not being practicable, on account of extreme illness or otherwise, the prevention of all intercourse with the sick, even of the family of the person attacked, must be rigidly observed, unless the individuals who desire to stay shall submit to such strict rules of quarantine as the public safety may demand, and the local Board of Health, advising with the Board of Health in London, may consider expedient.

As success in the treatment of this disease, and preventing it spreading, have been found greatly to depend upon *early* medical assistance, it is of great importance that the heads of families should be vigilant in guarding against concealment or delay in making known every case which may occur.

On the removal of diseased persons, the rooms they may have inhabited, and the house generally, should be thoroughly exposed to a constant current of air, and recourse had to all the well-known means of purifying houses, particularly the use of chloride of lime; and the bedding and clothing of the sick person, after removal, should be soaked in a slight solution of the chloride in water, and well washed. It is impossible that ventilation and cleanliness can be carried too far in the houses of the sick after removal; whitewashing, and a variety of means of effecting so important an object, will no doubt occur to the local Boards of Health, and a continuance of ventilation for some days, as the best means of preventing contagion.

In large towns the local Board of Health should be composed of sufficient numbers to admit of subdivision into district committees, always attaching to each committee at least one medical gentleman.

For the information of the public, and to secure a ready and instant reference to authorised persons, the names and residence of the persons composing the local Boards of Health should be placed on the church door.

In the event of so great a calamity falling upon this country as the introduction of this disease, rules and regulations upon an extensive scale, suited to the rigid system of quarantine which such an event would demand, will be immediately circulated by the Lords of his Majesty's Most Honourable Privy Council, who will, upon the earliest intimation of the existence of the disease, send down a medical practitioner, who has been acquainted with the disease as it occurred in India.[1]

In the name of the Board,
HENRY HALFORD, President.

MEDICINE AND THE LAW.

A Certificate of the Cause of Death followed by an Inquest.

A MEDICAL correspondent has written to us concerning the following case in which he gave a certificate of the cause of death but in which, nevertheless, the coroner decided to hold an inquest. Our correspondent operated on a Sunday upon an appendix abscess which he opened and drained. The patient was under chloroform for 35 minutes and appeared to recover satisfactorily from the effect of the anæsthetic, but eventually died on the Saturday morning following the operation, his symptoms causing the surgeon to certify the cause of death as appendix abscess and, secondarily, chloroform poisoning. The registrar, on receiving this certificate, did not register the death but communicated with the coroner, who held an inquest, a course which is hardly surprising, although it seems to have been unexpected by the surgeon who gave the certificate in question. If the coroner had not decided to hold an inquest the registrar would have registered the death as certified. The Departmental Committee, which has recently considered the question of deaths due to the administration of anæsthetics, may possibly recommend some special mode of inquiry with regard to them. At present a coroner has to decide for himself whether the facts known or believed to exist with regard to a particular case render it one in which the law makes it his duty to hold an inquest. In a large number of cases death follows upon surgical operations necessitated by physical conditions arising more or less naturally, and no inquest is held. This is presumably upon the ground that such deaths are primarily due to the natural causes which the operation failed to remove, and are not violent or unnatural deaths or sudden deaths of which the cause is unknown. In any case it is an established practice not to hold inquests upon them, although coroners are not unanimous in their opinions on the subject. With regard to deaths due to the administration of anæsthetics the case is different. Such administration conducted by qualified persons under normal conditions is not dangerous, and it is not unreasonable to regard a death ensuing upon, and stated to be due to, the administration of chloroform as sufficiently unnatural or open to the suggestion of doubt as to its cause to justify an inquest. The whole question of coroners' inquests, including that arising out of deaths due to anæsthetics, as has been said, is under consideration, and legislation upon the subject may be expected to follow in due course. It may be observed that the process by which notice of the death reaches the coroner, whether from the registrar or otherwise, has been the subject of evidence before the Committee. At present the registrar has duties to perform not entirely defined by statute. Here, again, certain matters may be regarded as being regulated by practice, and there are instructions of the Registrar-General for the guidance of the officials under him. Another correspondent, Mr. Ellis Pearson, who addresses us upon the subject discussed by Dr. E. J. Toye and Mr. F. W. Lowndes in letters to THE LANCET of July 31st and August 7th, sends us a form upon which in certain specified cases registrars are directed to report deaths to the coroner and not to register them until the latter has informed them that he will not hold an inquest. The same form requests the coroner either to forward the finding of the jury in due course or to give his reply, to the effect that an inquest will not be held, at his earliest convenience. With regard to the contention of Dr. Toye, in which Mr. Pearson concurs, that a medical man should give a certificate in all cases, it must be recollected that the section of the Births and Death [illegible] was passed in 1874 before the [illegible] now in force, and that it only ca[illegible] a medical man who has attende[illegible]

---

[1] In October, 1831, the Asiatic cholera having extended its ravages from Moscow to Hamburg, the full precautions to be taken were published in the *London Gazette* and an extract from them was published in THE LANCET of Oct. 29th, 1831, p 158 The instructions were issued by the Privy Council at the instance of the Board of Health. The Board of Health comprised the following gentlemen: Sir Henry Halford, President of the Royal College of Physicians, President; Dr. Holland, Dr. Maton, Dr. Turner, Dr. Warren, Dr. Macmichael, Fellows of the Royal College of Physicians; Sir T. Byam Martin, Comptroller of His Majesty's Navy, Hon. Edward Stewart, Deputy Chairman of Board of Customs; Sir James M'Grigor, Director-General of Army Hospitals; Sir William Burnett, Commissioner of Victualling Office; Sir William Pym, [illegible] ine, and Dr Edward James Seymou[illegible] ysicians, Secretary to the Board. T[illegible] is created some years afterward [illegible] "An [illegible] the Public Health," [illegible] & 12 [illegible] NCET [illegible] first considere[illegible] cle [illegible] comprehe[illegible] d for the hygienic regulation of the community." The "anti cholera" clause in it was introduced by Lord Morpeth.

[illegible] man giving the certificate knows that the coroner ought to inquire; that the registrar is not bound to register the death on receipt of the certificate, but may first communicate with the coroner, as in the case referred to above; and that a medical certificate will not be needed if an inquest is held. The most important point, however, seems to us to be the element of doubt which in some cases, and especially in those where there is a suspicion of criminal conduct, renders it undesirable for a medical man to bind himself down unnecessarily to a formal written statement which may afterwards be proved to be erroneous.

Damages Recovered against a Hospital in Scotland.

In the Edinburgh sheriff court recently damages were awarded to a plaintiff who claimed them in respect of injuries sustained by her through being burned on the leg by a hot-water bottle when under an anæsthetic for an operation. The claim was made against the Edinburgh Hospital and Dispensary for Women and Children, and consequently from the report before us the sheriff substitute, who found for the plaintiff, or pursuer, adopted a different view of the law from that enunciated recently by the Court of Appeal in the case of Hillyer *v.* the Corporation of London, commented on in THE LANCET of July 31st, p. 317. The judgments of the Court of Appeal in England are not binding upon the inferior courts of Scotland, or *vice versâ*, although they are often cited and should receive the consideration due to them. It will be interesting to see whether appeal follows in the case referred to and with what result, and whether the question comes ultimately in one case or the other before the House of Lords.

Quack Medicines and Stamp Duty.

Dr. F. J. Waldo recently made some plain-spoken observations upon the policy of the State in deriving a revenue from the sale of stamps for nostrums and "patent" medicines, which cause the ignorant to believe that the merits of the article thus distinguished are certified by the Government of the country. In the case before him, the infant child of an omnibus driver had died when being taken to Guy's Hospital, the death being stated by a member of the staff of the hospital to have been due to status lymphaticus, and the coroner's remarks on the subject of quack medicines and stamps were evoked by an admission on the part of the mother that she had been treating her child herself with a "teething powder." Dr. Waldo elicited medical evidence for the benefit of the jury and others present as to the dangerous drugs present in many of the secret remedies sold and their effect in increasing the high rate of infant mortality.

BRITISH MEDICAL BENEVOLENT FUND.

AT the August meeting of the committee 16 cases were considered and grants amounting to £155 made to 15 of the applicants. Appended is an abstract of the cases relieved:—

Widow, aged 39 years, of M.D., C.M. Aberd. Left penniless at husband's sudden death three years ago, and now endeavours to support herself by letting lodgings. Two children, aged 11 and nine years. Relieved twice, £10 Voted £12

Daughter, aged 63 years, of late M.R.C.S., L.S.A. Used to act as a [illegible] is now unable to obtain a post on account of [illegible] practice, but compelled to [illegible] Voted £18. [illegible] is supported [illegible] eble health.

[illegible] Voted £10.

[illegible] of late L.R.C.P. Irel. Since father's death in [illegible] aching, but now finds it impossible to [illegible] an elder sister whose income is only [illegible]

[illegible] ears. Practises near London, but is in ill health. Four children, aged 12 to [illegible] '16.

Daughter, aged 60 years, of late M.R.C.S. Maintained herself as a dispenser for several ye[illegible] r post. Small earnings by wood[illegible] ho has to earn her own living. [illegible]

M.R.C.S., aged 70 yea[illegible] Only income an Epsom Coll[illegible] m son earning a small weekly [illegible] in one sum.

[illegible] of late M.R.C.S., L.S.A. Used to be a house-[illegible] Relieved three times, [illegible]

[illegible] Lond. Was at one [illegible] operty to assist her [illegible] repay the loan. Has just obtained a pension from another charity. Relieved twice, £22. Voted £5.

Widow, aged 50 years, of L.R.C.P., L.R.C.S. Edin. Quite unprovided [illegible] slight help from a brother-in-[illegible] aged 18 and 16 [illegible] nall income but is [illegible] Relieved seven times, £60. Voted £5.

Daughter, aged 57 years, of L.F.P[illegible] the age of 16 years and helped to [illegible] Now unable to command a salary [illegible]

[illegible] No income, and at husband's [illegible] sed barely sufficient to pay [illegible] ildren. Relieved twice, £20. Voted £10.

Contributions may be sent to the treasurer, Dr. Samuel West, 15, Wimpole-street, London, W.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN 76 of the largest English towns 7815 births and 3721 deaths were registered during the week ending August 21st. The annual rate of mortality in these towns, which had been equal to 10·5 and 11·5 per 1000 in the two preceding weeks, further rose to 11·8 in the week under notice. During the previous weeks of the current quarter the annual death-rate in these towns has not exceeded 11·2 per 1000, the rate in London during the same period having been so low as 10·8. The lowest rates of mortality recorded in these 76 towns were 4·4 in Hornsey, 5·2 in East Ham, 5·7 in Walthamstow, and 6·3 in Ipswich; the rates in the other towns ranged upwards to 17·1 in Sheffield, 17·3 in Bootle, 17·9 in Blackburn, 18·8 in Middlesbrough, and 20·2 in Swansea. In London the recorded death-rate was 11·1 per 1000, and slightly lower than in the previous week. The 3721 deaths in the 76 towns showed a further increase of 89 upon the low numbers in the two preceding weeks, and included 604 which were referred to the principal epidemic diseases, against numbers increasing from 314 to 412 in the four previous weeks; of these 604 deaths 429 resulted from diarrhœa, 63 from measles, [illegible] whooping-cough, 30 from diphtheria, 25 from scar[illegible] (principally enteric), but not [illegible] deaths from these epidemic diseases during the week under notice were equal to an annual rate of 1·9 per 1000, against 1·0, 1·1, and 1·3 in the three preceding weeks. No death from any of these epidemic diseases was registered in Hornsey, Ipswich, Grimsby, Stockport, Wallasey, or in West Hartlepool; the annual death-rates therefrom ranged upwards, however, to 4·8 in Nottingham, 4·9 in Aston Manor, 5·0 in Sheffield, 6·0 in Bootle, and 9·0 in Swansea. The deaths, mainly infantile, attributed to diarrhœa in the 76 towns, which had steadily increased in the six preceding weeks from 63 to 208, further rose to 429 in the week under notice, and caused annual death-rates ranging upwards to 4·2 in Nottingham, 4·3 in Aston Manor and in Warrington, 4·9 in Sheffield, 5·3 in Bootle, and 8·0 in Swansea. The 63 fatal cases of measles showed a further decline from the numbers in recent weeks; the highest death-rates from this disease were 1·1 in Salford and 3·3 in Newport (Mon.) The deaths from whooping-cough, which had been 52 and 37 in the two preceding weeks, rose again to 42 in the week under notice. The 30 fatal cases of diphtheria were fewer than in any recent week, but caused death-rates equal to 1·1 in Salford and 1·7 in Barrow-in-Furness. The 25 deaths from scarlet fever also showed a decline from recent weekly numbers; they included 10 in London and its suburban districts, and five in Birmingham. The 15 deaths referred to "fever" corresponded with the number in the previous week; two were recorded in Halifax and four in London. The number of scarlet fever patients under treatment in the Metropolitan Asylums and London Fever Hospitals, which had declined in the five preceding weeks from 2737 to 2518, had further fallen to 2411 on August 21st; 245 new cases of this disease were admitted to these hospitals during the week under notice, against 280 and 298 in the two previous weeks. The deaths referred to pneumonia and other diseases of the respiratory organs in London were 122 in the week under notice, against 125 in the previous week, and were one below the corrected average number in the corresponding week of the five years 1904–08. The deaths of infants under one year of age in the 76 towns, which had been 688, 757, and 828 in the three preceding weeks, rose to 1007 in the week under notice. The causes of 24, or 0·6 per cent., of the deaths registered in the 76 towns during the week were not certified either by a registered medical practitioner or by a coroner. The causes of all the deaths were duly certified in Birmingham, Bristol, West Ham, Bradford, Newcastle-on-Tyne, Hull, and in 55 other smaller towns; the 24 uncertified causes of death in the 76 towns included six in Liverpool, and two each in Manchester, Sheffield, Sunderland, and Preston. The causes of all but one of the 1027 deaths in London were duly certified.

In 76 of the largest English towns 8316 births and 4073 deaths were registered during the week ending August 28th. The annual rate of mortality in these towns, which had been equal to 10·5, 11·5, and 11·8 per 1000 in the three preceding weeks, further rose to 12·9 in the week under notice. During the first eight weeks of the current quarter the annual death-rate in these towns, however, averaged only 11·4 per 1000, and the rate in London during the same period did not exceed 11·0 per 1000. The lowest annual rates of mortality recorded in the 76 towns last week were 3·7 in Handsworth, 3·8 in Hornsey, 5·2 in East Ham, and 5·6 in Tottenham; the rates in the other towns ranged upwards, however, to 19·5 in Bootle and in Warrington, 20·7 in Grimsby, and 26·5 in Swansea. In London the recorded death-rate last week was equal to 12·4 per 1000. The 4073 deaths in the 76 towns last week showed a further increase of 352 upon the low numbers returned in the three preceding weeks, and included 853 which were referred to the principal epidemic diseases, against numbers increasing from 314 to 606 in the five preceding weeks; of these 853 deaths, 680 resulted from diarrhœa, 57 from whooping-cough, 50 from measles, 30 from scarlet fever, 29 from diphtheria, and seven from "fever" (principally enteric), but not one from small-pox. The 853 deaths from these epidemic diseases last week were equal to an annual rate of 2·7 per 1000, against rates increasing from 1·0 to 1·9 in the four previous weeks. No death from any of these epidemic diseases was registered last week in Rochdale, Handsworth, Hastings, or in Barrow-in-Furness; the annual death-rates therefrom ranged upwards, however, to 7·1 in Grimsby, 7·6 in Hanley, 7·9 in Warrington, and 10·6 in Swansea. The deaths attributed to diarrhœa in the 76 towns, which had increased from 49 to 429 in the eight preceding weeks, further rose last week to 680, and caused annual death-rates ranging upwards to 5·3 in Liverpool and in Bootle, 5·8 in Rhondda, 5·9 in Nottingham, 7·2 in Warrington, and 9·5 in Swansea. The 57 deaths from whooping-cough also showed an increase upon the numbers returned in recent weeks, the highest death-rates from this disease being 1·1 in Walthamstow, 1·2 in Derby, and 1·5 in Hanley and in Middlesbrough. The 50 fatal cases of measles, however, showed a further considerable decline from recent weekly numbers, although they caused death-rates equal to 2·0 in Stockton, 2·2 in West Bromwich, and 4·7 in Newport (Mon). The 30 deaths from scarlet fever exceeded the number in the previous week by five, and included six in London, four in Birmingham and Aston Manor, three in Liverpool, four in Manchester and Salford, and two in Newcastle-on-Tyne. The 29 fatal cases of diphtheria were within one of the number in the previous week; nine were recorded in London and its suburban districts and two each in Portsmouth, Hanley, Manchester, and Sheffield. Only seven deaths were last week referred to "fever" in the 76 towns, of which two occurred in Grimsby. The number of scarlet fever patients under treatment in the Metropolitan Asylums and the London Fever Hospitals, which had declined in the six preceding weeks from 2737 to 2411, had further fallen to 2347 at the end of last week; 284 new cases of this disease were admitted to these hospitals during last week, against 298 and 245 in the two preceding weeks. Of the 1153 deaths registered in London last week, 103 were referred to pneumonia and other diseases of the respiratory system, and were five below the corrected average number in the corresponding period of the five years 1904–08. The causes of 29, or 0·7 per cent., of the deaths registered in the 76 towns last week were not certified either by a registered medical practitioner or by a coroner. All the causes of death registered during last week were duly certified in Leeds, Bristol, West Ham, Bradford, Newcastle-on-Tyne, Hull, Nottingham, and in 52 smaller towns; the 29 uncertified causes of death in the 76 towns included five in Liverpool, four in Birmingham, and two each in Manchester, Sunderland, Bolton, South Shields, and Gateshead.

HEALTH OF SCOTCH TOWNS.

In eight of the principal Scotch towns 864 births and 428 deaths were registered during the week ending August 21st. The annual rate of mortality in these towns, which had been equal to 12·0 and 12·6 per 1000 in the two preceding weeks, declined again to 12·0 in the week under notice. During the first seven weeks of the current quarter the death-rate in these Scotch towns averaged 12·3 per 1000; in the 76 large English towns the mean death-rate during the same period did not exceed 11·2. The death-rate during the week under notice in these Scotch towns ranged from 10 1 in Greenock and 11·6 in Glasgow and in Edinburgh, to 14·0 in Leith and 15·6 in Perth. The 428 deaths in the eight towns showed a decline of 24 from the number in the previous week, and included 59 which were referred to the principal epidemic diseases, against 39, 50, and 44 in the three preceding weeks. These 59 deaths were equal to an annual rate of 1·7 per 1000, against 1·4 and 1·2 in the two previous weeks; the rate during the week from the same epidemic diseases in the 76 large English towns was equal to 1·9, owing to the increased fatality of infantile diarrhœa. Of the 59 deaths from these epidemic diseases in the eight Scotch towns, 26 resulted from diarrhœa, 10 from diphtheria, nine from whooping-cough, seven from measles, four from scarlet fever, and three from "fever," but not one from small-pox. The deaths attributed to diarrhœa in the eight towns, which had been 20 and 17 in the two previous weeks, rose to 26 in the week under notice, and exceeded the number in any previous week of this year; 16 were recorded in Glasgow and three each in Edinburgh, Dundee, and Greenock. The 10 fatal cases of diphtheria also exceeded the number in any recent week, and included seven in Glasgow and two in Aberdeen. Of the nine deaths from whooping-cough, corresponding with the number in the previous week, three occurred both in Glasgow and in Edinburgh. The seven fatal cases of measles included four in Glasgow and two in Paisley; and two of the four deaths from scarlet fever were recorded in Edinburgh. The three deaths referred to "fever" were fewer by four than the number in the previous week; one from cerebro-spinal meningitis occurred both in Glasgow and in Dundee, and one from enteric in Edinburgh. The deaths from diseases of the respiratory organs in the eight towns, which had been 51 and 48 in the two previous weeks, further declined to 39 in the week under notice, and were nine below the number in the corresponding week of last year. The deaths in the eight towns during the week included 18 which were referred to different forms of violence, including 10 in Glasgow, three in Dundee, and two in Edinburgh. The causes of 10, or 2·3 per cent., of the deaths in the eight towns during the week were not certified; in the 76 English towns the proportion of uncertified causes of death during the same week did not exceed 0·6 per cent.

In eight of the principal Scotch towns 827 births and 454 deaths were registered during the week ending August 28th. The annual rate of mortality in these towns, which had been equal to 12·6 and 12·0 per 1000 in the two preceding weeks, rose again to 12·7 in the week under notice. During the first eight weeks of the current quarter the death-rate in these Scotch towns averaged 12·4 per 1000, and exceeded by 1·0 the mean rate during the same period in the 76 large English towns. The death-rates last week in these Scotch towns ranged from 8·5 both in Leith and in Perth, to 13·7 in Greenock and 20·3 in Dundee. The 454 deaths from all causes in the eight towns showed an increase of

26 upon the number in the previous week, and included 64 which were referred to the principal epidemic diseases, against 44 and 59 in the two preceding weeks. These 64 deaths were equal to an annual rate of 1·8 per 1000, which was 0·9 below the mean rate from the same diseases last week in the 76 English towns. Of the 64 deaths from these epidemic diseases, 47 resulted from diarrhœa, seven from whooping-cough, three each from measles and scarlet fever, and two each from diphtheria and "fever," but not one from small-pox. The fatal cases of diarrhœa, which had been 17 and 26 in the two preceding weeks, further rose to 47 last week, and included 28 in Glasgow, five each in Dundee and in Greenock, and three each in Edinburgh and in Paisley. The seven fatal cases of whooping-cough showed a further decline from the numbers in recent weeks; three were recorded in Glasgow. The three deaths both from measles and from scarlet fever also showed a decline, including two from measles in Paisley and two from scarlet fever in Glasgow. The two deaths referred to diphtheria and the two from "fever" were all returned in Glasgow; of the two deaths from "fever," one was certified as enteric and the other as cerebro-spinal meningitis. The deaths referred to diseases of the respiratory organs in these eight Scotch towns, which had been 51, 48, and 39 in the three preceding weeks, rose again to 45 last week, but were 30 below the number in the corresponding week of last year. The deaths in these towns last week included 13 which were referred to different forms of violence, of which eight occurred in Glasgow, three in Dundee, and two in Edinburgh. The causes of ten, or 2·2 per cent., of the deaths in the eight towns last week were not certified; in the 76 English towns the proportion of uncertified causes of death did not exceed 0·7 per cent.

HEALTH OF DUBLIN.

The annual rate of mortality in Dublin, which had been equal to 17·4, 15·2, and 13·5 per 1000 in the three preceding weeks, rose to 19·8 in the week ending August 21st. During the first seven weeks of the current quarter the death-rate in the city averaged 16·1 per 1000, whereas the mean rate during the same period did not exceed 10·8 in London and 12·4 in Edinburgh. The 151 deaths of Dublin residents registered in the week under notice showed an increase of 48 upon the number in the previous week, and included 23 which were referred to the principal epidemic diseases, against 12 in each of the two previous weeks. These 23 deaths were equal to an annual rate of 3·0 per 1000, the death-rate from the same diseases during the week being 1·3 in London and 1·5 in Edinburgh. Of the 23 deaths in Dublin from these epidemic diseases, 20 resulted from diarrhœa, and one each from scarlet fever, diphtheria, and whooping-cough, but not one either from measles, "fever," or small-pox. The deaths attributed to diarrhœa in the city, which had been five and nine in the two preceding weeks, rose to 20 in the week under notice. The 151 deaths at all ages included 44 of infants under one year of age and 39 of persons aged upwards of 60 years; both these numbers showed a considerable increase upon those returned in recent weeks. Five inquest cases and three deaths from violence were registered; and 61, or 40·4 per cent., of the deaths occurred in public institutions. The causes of three, or 2·0 per cent., of the 151 deaths in Dublin during the week were not certified either by a registered medical practitioner or by a coroner; in London the causes of all but one of the 1027 deaths, and in Edinburgh the cause of all the 79 deaths, were duly certified.

The annual rate of mortality in Dublin, which had been equal to 13·5 and 19·8 per 1000 in the two preceding weeks, further rose to 20·4 in the week ending August 28th. During the first eight weeks of the current quarter the death-rate in the city averaged 16·7 per 1000, whereas the mean rate during the same period did not exceed 11·0 in London and 12·2 in Edinburgh. The 156 deaths of Dublin residents registered during last week showed a further increase of five upon the numbers in the two preceding weeks, and included 37, which were referred to the principal epidemic diseases, against 12 and 23 in the two previous weeks. These 37 deaths were equal to an annual rate of 4·8 per 1000, the death-rate from the same diseases last week being but 2·1 in London and 0·7 in Edinburgh. Of the 37 deaths from these epidemic diseases in Dublin, 30 resulted from diarrhœa, five from whooping-cough, and one each from diphtheria and "fever," but not one either from measles, scarlet fever, or small-pox. The fatal cases both of diarrhœa and whooping-cough showed a marked increase on recent weekly numbers. Of the 156 deaths at all ages, 55 were of infants under one year of age, and 29 of persons aged upwards of 60 years; the deaths of infants showed a further considerable increase, and exceeded the number in any previous week of this year. Two inquest cases and two deaths from violence were registered during the week, and 54, or 34·6 per cent., of the deaths occurred in public institutions. The causes of four, or 2·6 per cent., of the deaths in Dublin last week were not certified either by a registered medical practitioner or by a coroner; in London the causes of all but one of the 1153 deaths were duly certified, while the proportion of uncertified causes in Edinburgh was equal to 2·8 per cent.

VITAL STATISTICS OF LONDON DURING JULY, 1909.

IN the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases, it appears that the number of persons reported to be suffering from one or other of the nine diseases specified in the table was equal to an annual rate of 6·4 per 1000 of the population, estimated at 4,833,938 persons in the middle of the year; in the three preceding months the rates were 5·4, 6·1, and 6·5 per 1000 respectively. The lowest rates last month were recorded in Kensington, Stoke Newington, Hackney, the City of London, Lambeth, and Deptford; and the highest rates in St. Marylebone, Bethnal Green, Stepney, Poplar, Lewisham, and Woolwich. Scarlet fever was slightly less prevalent than it had been in the preceding month; the greatest proportional prevalence of this disease was recorded in Paddington, St. Marylebone, Hampstead, Bethnal Green, Poplar, and Woolwich. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals, which had been 2143, 2207, and 2539 at the end of the three preceding months, had further risen to 2628 at the end of last month; the weekly admissions averaged 358, against 262, 318, and 353 in the three preceding months. The prevalence of diphtheria showed a slight increase over that recorded in the previous month; among the various boroughs this disease was proportionally most prevalent in Fulham, Finsbury, the City of London, Stepney, Greenwich, and Lewisham. The Metropolitan Asylums Hospitals contained 890 diphtheria patients at the end of last month, against 1012, 920, and 890 at the end of the three preceding months; the weekly admissions averaged 107, against 109, 103, and 105 in the three preceding months. Enteric fever was less prevalent than in any previous month in this year. The greatest proportional prevalence of this disease occurred in Islington, Stoke Newington, Holborn, Bethnal Green, Southwark, and Camberwell. The number of enteric fever patients under treatment in the Metropolitan Asylums Hospitals at the end of last month was 60, against 57, 49, and 58 at the end of the three preceding months; the weekly admissions averaged seven, against seven, eight,

. .

Shoreditch, Stepney, and Poplar. [illegible] five in Fulham, fever notified during the month included five in Fulham, two in Battersea, and one each in ten other boroughs. Of the seven cases notified as cerebro-spinal meningitis, two belonged to St. Pancras, and one each to Fulham, St. Marylebone, Hackney, Finsbury, and Poplar.

[illegible] statistics in the table relate to the deaths of [illegible] various boroughs, the deaths been distributed among the several boroughs in which the deceased persons had previously resided. During the four weeks ending July 31st the deaths of 3757 London residents were registered, equal to an annual rate of 10·2 per 1000; in the three preceding months the rates were 15·0, 12·9, and 11·1 per 1000. The lowest rates recorded last month were 5·8 in Hampstead, 7·6 in Greenwich, 7·7 in Lewisham, 8·4 in Woolwich, 8·5 in Wandsworth, and 9·0 in Lambeth; the highest rates were 12·0 in Shoreditch, 12·6 in Southwark, 12·8 in Holborn, 13·3 in Finsbury, and 14·0 in Bethnal Green. The 3757 deaths from all causes included 307 which were referred to the principal infectious diseases; of these 104 resulted from measles, 26 from scarlet fever, 35 from
